1 Introduction

The probsoln package is designed for teachers or lecturers who want to create problem sheets for their students. This package was designed with mathematics problems in mind, but can be used for other subjects as well. The idea is to create a file containing a large number of problems with their solutions which can be read in by \LaTeX, and then select a number of problems to typeset. This means that once the database has been set up, each year you can easily create a new problem sheet that is sufficiently different from the previous year, thus preventing the temptation of current students seeking out the previous year’s students, and checking out their answers. There is also an option that can be passed to the package to determine whether or not the solutions should be printed. In this way, one file can either produce the student’s version or the teacher’s version.

You may want to consider using datatool with datatooltk instead of probsoln. See Using the datatool Package for Exams or Assignment Sheets.

2 Package Options

The following options may be passed to this package:

- **answers** Show the answers
- **noanswers** Don’t show the answers (default)
- **draft** Display the label and dataset name when a problem is used
- **final** Don’t display label and dataset name when a problem is used
- **usedefaultargs** Make \thisproblem use the default arguments supplied in the problem definition.
- **nusedefaultargs** Make \thisproblem prompt for problem arguments (default).

3 Verbatim

As from version 3.02, problems and solutions may contain verbatim text, but you must use the `fragile` (or `fragile=true`) option for the associated environments.

Alternatively, if most of your problems contain verbatim, you can globally set this option using:
You can switch off this option using `fragile=false`. The `fragile` option writes information to a temporary file. This defaults to `.jobname.vrb` but the name may be changed. The extension (.vrb) is given by:

\ProbSolnFragileExt

The base name (`\jobname`) is given by:

\ProbSolnFragileFile

### 4 Showing and Hiding Solutions

In addition to the `answers` and `noanswers` package options, it is also possible to show or suppress the solutions using `\showanswers` and `\hideanswers` respectively.

The boolean variable `showanswers` determines whether the answers should be displayed. You can use this value with the `ifthen` package to specify different text depending on whether the solutions should be displayed. For example:

Assignment 1\ifthenelse{\boolean{showanswers}}{(Solution Sheet)}{}

Alternatively you can use `\ifshowanswers...\else...\fi`:

Assignment \ifshowanswers\space (Solution Sheet)\fi

For longer passages, you can use the environments `\begin{onlyproblem}` and `\begin{onlysolution}`.

\begin{onlyproblem}
What is the derivative of $f(x) = x^2$?
\end{onlyproblem}

```latex
\begin{onlyproblem}
What is the derivative of $f(x) = x^2$?
\end{onlyproblem}
```
The above will only display the question if `showanswers` is false and will only display the solution if `showanswers` is true. If you want the question to appear in the answer sheet as well as the solution, then don’t put the question in the `onlyproblem` environment:

What is the derivative of $f(x) = x^2$?

\begin{onlysolution}
Solution: $f'(x) = 2x$
\end{onlysolution}

If you want to include verbatim text in the body of `onlyproblem` or `onlysolution`, you need to specify `fragile` in the optional argument of the environment. (See Section 3 for further details.)

If you use `onlysolution` within the `defproblem` environment, the problem will be tagged as having a solution and will be added to the list used by `\foreachsolution`. The optional argument of `onlysolution` (and `onlyproblem`) is inherited from the parent `defproblem` setting.

5 General Formatting Commands

The commands and environments described in this section are provided to assist formatting problems and their solutions.

\begin{solution}⟨text⟩\end{solution}

By default, this is equivalent to

\par\noindent{textbf{solutionname}: }⟨text⟩

where `solutionname` defaults to “Solution”. Note that you must place the `solution` environment inside the `onlysolution` environment or between `\ifshowanswers`...`\fi` to ensure that it is suppressed when the solutions are not wanted. (See Section 4.)

Note that the `probsoln` package will only define the `solution` environment if it is not already defined.

\begin{textenum}...
\end{textenum}

The `textenum` environment is like the `enumerate` environment but is in-line. It uses the same counter that the `enumerate` environment would use at that level so the question can be compact but the answer can use `enumerate` instead. For example:
Differentiate the following:

\begin{textenum}
\item $f(x)=2^x$; \item $f(x)=\cot(x)$
\end{textenum}

\begin{enumerate}
\item
\begin{align*}
f(x) &= 2^x = \exp(\ln(x^2)) =\exp(2\ln(x)) \\
f'(x) &= \exp(2\ln(x))\times \frac{2}{x} \\
&= f(x)\frac{2}{x}
\end{align*}
\item
\begin{align*}
f(x) &= \cot(x) = (\tan(x))^{-2} \\
f'(x) &= -(\tan(x))^{-2}\times\sec^2(2x) \\
&=-\csc^2x
\end{align*}
\end{enumerate}

In this example, the items in the question are brief, so an \texttt{enumerate} environment would result in a lot of unnecessary white space, but the answers require more space, so an \texttt{enumerate} environment is more appropriate. Since the \texttt{textenum} environment uses the same counters as the \texttt{enumerate} environment, the question and answer sheets use consistent labelling. Note that there are other packages available on CTAN that you can use to create in-line lists. Check the TeX Catalogue\footnote{http://www.tex.ac.uk/tex-archive/help/Catalogue/bytopic.html#enumeration} for further details.

\texttt{\correctitem} \texttt{\incorrectitem}

\texttt{\correctitemformat{\langle label\rangle}} \texttt{\incorrectitemformat{\langle label\rangle}}

For example:

Under which of the following functions does $S=\{a_1,a_2\}$ become a probability space?
\begin{enumerate}
\begin{enumerate}
\item $P(a_1) = \frac{1}{3}$, $P(a_2) = \frac{1}{2}$
\item $P(a_1) = \frac{3}{4}$, $P(a_2) = \frac{1}{4}$
\item $P(a_1) = 1$, $P(a_2) = 0$
\item $P(a_1) = \frac{5}{4}$, $P(a_2) = -\frac{1}{4}$
\end{enumerate}

The default definition of \texttt{correctitem} puts a frame around the label.

\section{Defining a Problem}

It is possible to construct a problem sheet with solutions using the commands described in the previous sections, however it is also possible to define a set of problems for later use. In this way you can create an external file containing many problems some or all of which can be loaded and used in a document. The \texttt{probsoln} package has a default data set labelled “default” in which you can store problems. Alternatively, you can create multiple data sets. You can then iterate through each problem in a problem set. You can use a previously defined problem more than once, which means that by judicious use of \texttt{onlyproblem}, \texttt{onlysolution} or the \texttt{showanswers} boolean variable in conjunction with \texttt{showanswers} and \texttt{hideanswers}, you can print the solutions in a different location to the questions (for example in an appendix).

\begin{defproblem}
\[(n)\] \begin{enumerate}[default args]
\item \langle label \rangle
\end{enumerate}
\end{defproblem}

This defines the problem whose label is given by \langle label \rangle. The label must be unique for a given data set and should not contain active characters or a comma. (Active characters include the special characters such as $ and &), but some packages may make other symbols active, such as the colon (:) character. For example, the \texttt{ngerman} and \texttt{babel} packages make certain punctuation active. Check the relevant package documentation for details.)

The final optional argument \langle option \rangle may be \texttt{fragile} to indicate that the problem contains verbatim text. Any occurrences of \texttt{onlyproblem} or \texttt{onlysolution} contained within \texttt{defproblem} are inherited from \texttt{defproblem}. (See Section 3 for further details.)

If \texttt{defproblem} occurs in the document or is included via \texttt{input} or \texttt{include}, then the problem will be added to the default data set. If \texttt{defproblem} occurs in an external file that is loaded using one of the commands defined in Section 8 then the problem will be added to the specified data set.

The contents of the \texttt{defproblem} environment should be the text that defines the problem. This may include any of the commands defined in Section 4 and Section 5.

The problem may optionally take \langle n \rangle arguments (where \langle n \rangle is from 0 to 9). The arguments can be referenced in the definition via \#1,...,\#9. If \langle n \rangle is omitted then the
problem doesn’t take any arguments. The following example defines a problem with one argument:

\begin{defproblem}[1]{diffsin}
Differentiate $f(x)=\sin(#1x)$.
\begin{onlysolution}
\begin{solution}
$f'(x) = #1\cos(#1x)$
\end{solution}
\end{onlysolution}
\end{defproblem}

The second optional argument \texttt{(default args)} supplies default problem arguments that will automatically be used within \texttt{thisproblem} when used in \texttt{foreachproblem} in conjunction with the package option \texttt{usedefaultargs}. (See Section 9.) For example:

\begin{defproblem}[1][2]{diffsin}
Differentiate $f(x)=\sin(#1x)$.
\begin{onlysolution}
\begin{solution}
$f'(x) = #1\cos(#1x)$
\end{solution}
\end{onlysolution}
\end{defproblem}

If you don’t use \texttt{thisproblem} or you don’t use the package option \texttt{usedefaultargs}, then you must supply the arguments.

\newproblem
\newproblem[\langle n \rangle][\langle default args \rangle][\langle label \rangle][\langle problem \rangle][\langle solution \rangle]

This is a shortcut command for:
\begin{defproblem}[\langle n \rangle][\langle default args \rangle][\langle label \rangle][\langle problem \rangle][\langle solution \rangle]
\begin{onlysolution}
\begin{solution}
\end{solution}
\end{onlysolution}
\end{defproblem}

For example:
\begin{defproblem}[1]{diffcos}{
\(f(x) = \cos(#1x)\)}
\end{defproblem}
\begin{onlysolution}
\begin{solution}
\(f'(x) = -#1\sin(#1x)\)
\end{solution}
\end{onlysolution}
is equivalent to

\begin{defproblem}[1]{diffcos} 
  \(f(x) = \cos(#1x)\) 
\end{defproblem}

\begin{onlysolution} 
\begin{solution} 
  \(f'(x) = -#1\sin(#1x)\) 
\end{solution} 
\end{onlysolution}

(In this example, the argument will need to be a positive number to avoid a double minus in the answer. If you want to perform floating point arithmetic on the arguments, then try the \texttt{fp} or \texttt{pgfmath} packages.)

Alternatively, if you want to supply default arguments to use when iterating through problems with \texttt{\foreachproblem}:

\texttt{\newproblem*[⟨n⟩][⟨default args⟩]⟨label⟩}{⟨definition⟩}

This is a shortcut for:

\texttt{\begin{defproblem}[⟨n⟩][⟨default args⟩]⟨label⟩}{⟨definition⟩} \end{defproblem}

Note that you can’t use verbatim text with \texttt{\newproblem} or \texttt{\newproblem*}. Use the \texttt{defproblem} environment instead with the \texttt{fragile} option.

7 Using a Problem

Once you have defined a problem using \texttt{defproblem} or \texttt{\newproblem} (see Section 6), you can later display the problem using:

\texttt{\useproblem⟨data set⟩}{⟨label⟩}{⟨arg1⟩}...{⟨argN⟩}

where \texttt{(data set)} is the name of the data set that contains the problem (the default data set is used if omitted), \texttt{(label)} is the label identifying the required problem and \texttt{(arg1)}, \(\ldots\), \texttt{(argN)} are the arguments to pass to the problem, if the problem was defined to
have arguments (where \( N \) is the number of arguments specified when the problem was defined).

For example, in the previous section the problem \texttt{diffcos} was defined to have one argument, so it can be used as follows:

\begin{verbatim}
\useproblem{diffcos}{3}
\end{verbatim}

This will be equivalent to:

\begin{verbatim}
(f(x) = \cos(3x))
\begin{onlysolution}
\begin{solution}
(f'(x) = -3\sin(3x))
\end{solution}
\end{onlysolution}
\end{verbatim}

\section{8 Loading Problems From External Files}

You can store all your problem definitions (see Section 6) in an external file. These problems can all be appended to the default data set by including the file via \texttt{\input} or they can be appended to other data sets using one of the commands described below. Once you have loaded all the required problems, you can iterate through the data sets using the commands described in Section 9. Note that the commands below will create a new data set, if the named data set doesn’t exist.

\begin{verbatim}
\loadallproblems[(data set)]{(filename)}
\end{verbatim}

This will load all problems defined in \texttt{(filename)} and append them to the specified data set, in the order in which they are defined in the file. If \texttt{(data set)} is omitted, the default data set will be used. If \texttt{(data set)} doesn’t exist, it will be created.

\begin{verbatim}
\loadselectedproblems[(data set)]{(labels)}{(filename)}
\end{verbatim}

This is like \texttt{\loadallproblems}, but only those problems whose label is listed in the comma-separated list \texttt{(labels)} are loaded. For example, if I have some problems defined in the file \texttt{derivatives.tex}, then

\begin{verbatim}
\loadselectedproblems{diffsin,diffcos}{derivatives}
\end{verbatim}

will only load the problems whose labels are \texttt{diffsin} and \texttt{diffcos}, respectively. All the other problems in the file will remain undefined.

\begin{verbatim}
\loadexceptproblems[(data set)]{(exception list)}{(filename)}
\end{verbatim}

This is the reverse of \texttt{\loadselectedproblems}. This loads all problems except those whose labels are listed in \texttt{(exception list)}.
\texttt{\loadrandomproblems[(data set)]{(n)}{(filenames)}}

This randomly loads \(n\) problems from the comma-separated list\(^2\) of \(\text{filenames}\) and adds them to the given data set. If \(\text{data set}\) is omitted, the default data set is assumed. Note that the problems will be added to the data set in a random order, not in the order in which they were defined. There must be at least \(n\) problems defined across the given list of files.

Note that there’s a difference between

\begin{verbatim}
\loadrandomproblems{5}{problemset1}
\loadrandomproblems{5}{problemset2}
\end{verbatim}

and

\begin{verbatim}
\loadrandomproblems{10}{problemset1,problemset2}
\end{verbatim}

In the first case, the data set will contain 5 problems randomly selected from \texttt{problemset1} and 5 problems randomly selected from \texttt{problemset2}. Whereas in the second case, the data set will contain 10 problems randomly selected across both files.

\texttt{\loadrandomexcept[(data set)]{(n)}{(filenames)}{(exception list)}}

This is similar to \texttt{\loadrandomproblems} except that it won’t load those problems whose labels are listed in \(\text{exception list}\). \textbf{If you want to automatically exclude problems included in previous documents, see Section 8.1.}

Note that the random number generator has been modified in version 3.01 in order to fix a bug. If you want to ensure that your random numbers are compatible with earlier versions, you can switch to the old generator using

\texttt{\PSNuseoldrandom}

It is generally not a good idea to place anything in \(\text{filename}\) that is not inside the body of \texttt{defproblem} or in the arguments to \texttt{\newproblem} or \texttt{\newproblem*}. All the commands in this section input the external file within a local scope, so command definitions would need to be made global to have any effect. In addition, \texttt{\loadrandomproblems} has to load each file twice, which means that anything outside a problem definition will be parsed twice.

**8.1 Randomly Selecting Problems Not Selected in Previous Documents**

Suppose you have a large set of questions that you want to randomly select for assignments and exams. The chances are, you don’t want to include questions that have been

\(^2\) The list form was added to v3.05. Earlier versions only allow a single filename.
previously set for, say, the last three years. That is, you don’t want to select questions
the students may already have seen. As from version 3.03, you can now do this.

The probsoln package defaults to the UK academic year, which starts in September.
If this isn’t appropriate, you can change it using:

\SetStartMonth{(n)}

where \( n \) is the number of the month. (1 = January, 2 = February, etc.)

The start year is the calendar year in effect when the academic year started. For
example, if this is the academic year 2011/12, then the start year is 2011. This is
automatically set to the start of the current academic year. It is also updated when
\SetStartMonth is used.\(^3\) If you want to set it to a specific year, you can use:

\SetStartYear{(year)}

For example: \SetStartYear{2008} indicates the academic year 2008/9.

There are two files concerned with previously used labels. They are:

The previously used labels file This keeps track of all problems used in previous years,
as well as problems used by other documents that have this as their previously
used labels file, and it contains the problem labels from the last run of the current
document.

The current used labels file This defaults to \jobname.prb, but the name can be
changed using:

\SetUsedFileName{(name)}

This file keeps track of all the labels used in the current document from the previous
LaTeX run. Note that if you want to delete this file, first clear it using

\ClearUsedFile{(file)}

in place of \ExcludePreviousFile{(file)}, described below. The argument \( file \)
is the previously used labels file described above. \ClearUsedFile will remove all
labels in the current used labels file from the previously used labels file and clear
the current used labels file. Once this file is empty, it may then be deleted.

Before loading randomly selected problems, first specify the previously used labels file
with the command:

\ExcludePreviousFile[(number of years)]{(file name)}

\(^3\)So don’t use \SetStartMonth after \SetStartYear.
where \textit{file name} is the name of the previously used file. The optional argument \textit{number of years} specifies the year cut-off. This defaults to 3, which means that only those labels used this year or the previous 2 years will be kept. Any problems used before then may be reused.

Suppose I’m lecturing a first year undergraduate mathematics course (designated, say, mth101). I want to set assignments on each topic and an exam at the end of the year (as well as a resit or second sitting paper). I’ve got databases with problems for each topic, but the first and second sitting exams mustn’t include any of the problems used in the assignments or any problems used in assignments or exams for the previous two academic years. I’m going to arrange my directory structure as follows:

- mth101/
  - assignment1/ (differentiation)
    * assignment1.tex
  - assignment2/ (probability spaces)
    * assignment2.tex
  - assignment3/ (linear algebra)
    * assignment3.tex
  - exams/
    * exam.tex (first sitting)
    * resit.tex (second sitting)
  - databases/
    * differentiation.tex
    * probabilityspaces.tex
    * linearalgebra.tex
  - previouslabels.tex (created by probsoln)

9 Iterating Through Datasets

Once you have defined all your problems for a given data set, you can use an individual problem with \useproblem (see Section 7) but it is more likely that you will want to iterate through all the problems so that you don’t need to remember the labels of all the problems you have defined.

\begin{verbatim}
\foreachproblem[(data set)]{(body)}
\end{verbatim}

This does \textit{body} for each problem in the given data set. If \textit{data set} is omitted, the default data set is used. Within \textit{body} you can use
to use the current problem and

\thisproblemlabel

to access the current label. If the problem requires arguments, and no default arguments were supplied in the problem definition or the package option usedefaultargs was not used, then you will be prompted for arguments, so if you want to use this approach you will need to use \texttt{\LaTeX} in interactive mode. If you do provide arguments, they will be stored in the event that you need to iterate through the data set again. The arguments will be included in \thisproblem, so you only need to use \thisproblem without having to specify \useproblem.

For example, to iterate through all problems in the default data set:

\begin{enumerate}
\foreachproblem{\item\thisproblem}
\end{enumerate}

This is equivalent to \foreachproblem, but only iterates through problems that contain the onlysolution environment. Note that you still need to use \showanswers or the answers package option for the contents of the onlysolution environment to appear.

\foreachdataset{\\langle cmd \rangle}{\langle body \rangle}

This does \langle body \rangle for each of the defined data sets. Within \langle body \rangle, \langle cmd \rangle will be set to the name of the current data set. For example, to display all problems in all data sets:

\begin{enumerate}
\foreachdataset{\thisdataset}{%
\foreachproblem{\thisdataset}{\item\thisproblem}%
\end{enumerate}

Suppose I have two external files called derivatives.tex and probspaces.tex which define problems using both onlyproblem and onlysolution for example:

\begin{defproblem}{cosxsqsinx}\
begin{onlyproblem}$y = \cos(x^2)\sin x$.\
end{onlyproblem}\
begin{onlysolution}\
\[\frac{dy}{dx} = -\sin(x^2)2x\sin x + \cos(x^2)\cos x]\nend{onlysolution}\
end{defproblem}
I can write a document that creates two data sets, one for the derivative problems and one for the problems about probability spaces. I can then use `\hideanswers` and iterate through the require data set to produce the problems. Later, I can use `\showanswers` and iterate over all problems defined in both data sets to produce the chapter containing all the answers. When displaying the questions, I have taken advantage of the fact that I can cross-reference items within an `enumerate` environment, and redefined `\theenumi` to label the questions according to the chapter. The cross-reference label is constructed from the problem label and is referenced in the answer section to ensure that the answers have the same label as the questions.

```latex
\documentclass{report}
\usepackage{probsoln}
\begin{document}
\hideanswers
\chapter{Differentiation}
% randomly select 25 problems from derivatives.tex and add to
% the data set called 'deriv'
\loadrandomproblems[deriv]{25}{derivatives}
\renewcommand{\theenumi}{\thechapter.\arabic{enumi}}
\begin{enumerate}
\foreachproblem[deriv]{\item\label{prob:\thisproblemlabel}\thisproblem}
\end{enumerate}
% You may need to change \theenumi back here

\chapter{Probability Spaces}
% randomly select 25 problems from probspaces.tex and add to
% the data set called 'spaces'
\loadrandomproblems[spaces]{25}{probspaces}
\renewcommand{\theenumi}{\thechapter.\arabic{enumi}}
\begin{enumerate}
\foreachproblem[spaces]{\item\label{prob:\thisproblemlabel}\thisproblem}
\end{enumerate}
% You may need to change \theenumi back here

\appendix
\chapter{Solutions}
\showanswers
\begin{itemize}
\foreachdataset{\thisdataset}{\%}
\foreachproblem[\thisdataset]{\item[\ref{prob:\thisproblemlabel}]\thisproblem}
\end{itemize}
\end{document}
```

14
10 Random Number Generator

This package provides a pseudo-random number generator that is used by \loadrandomproblems. As noted earlier the random number generator has been modified in version 3.01 in order to fix a bug. If you want to ensure that your random numbers are compatible with earlier versions, you can switch to the old generator using

\PSNuseoldrandom

\PSNrandseed{\langle n \rangle}

This sets the seed to \langle n \rangle which must be a non-zero integer. For example, to generate a different set of random numbers every time you \LaTeX your document, put the following in your preamble:

\PSNrandseed\{\time\}

or to generate a different set of random numbers every year you \LaTeX your document:

\PSNrandseed\{\year\}

\PSNgetrandseed{\langle \text{register} \rangle}

This stores the current seed in the count register specified by \langle \text{register} \rangle. For example:

\newcount\myseed
\PSNgetrandseed\{\myseed\}

\PSNrandom{\langle \text{register} \rangle}{\langle n \rangle}

Generates a random integer from 1 to \langle n \rangle and stores in the count register specified by \langle \text{register} \rangle. For example, the following generates an integer from 1 to 10 and stores it in the register \texttt{\myreg}:

\newcount\myreg
\PSNrandom\{\myreg\}{10}

\random{\langle \text{counter} \rangle}{\langle \text{min} \rangle}{\langle \text{max} \rangle}

Generates a random integer from \langle \text{min} \rangle to \langle \text{max} \rangle and stores in the given counter. For example, the following generates a random number between 3 and 8 (inclusive) and stores it in the counter \texttt{\myrand}.

\newcounter{\myrand}
\random{\myrand}{3}{8}

*assuming you leave at least a minute between runs.*
Randomly selects \((n)\) values from the comma-separated list given by \((list)\) and iterates through this subset. On each iteration it sets \((cmd)\) to the current value and does \((text)\). For example, the following will load a randomly selected problem from two of the listed files (where \texttt{file1.tex}, \texttt{file2.tex} and \texttt{file3.tex} are files containing at least one problem):

\begin{verbatim}
\doforrandN{2}{\thisfile}{file1,file2,file3}{\%
\loadrandomproblems{1}{\thisfile}}
\end{verbatim}

\section{Compatibility With Versions Prior to 3.0}

Version 3.0 of the \texttt{probsoln} package completely changed the structure of the package, but the commands described in this section have been provided to maintain compatibility with earlier versions. The only problems that are likely to occur are those where commands are contained within groups. This will effect any commands that are contained in external files that are outside of the arguments to \texttt{\newproblem} and \texttt{\newproblem*}. However, since the external files had to be parsed twice in order to load the problems, this shouldn’t be an issue as adding anything other than problem definitions in those files would be problematic anyway.

The other likely difference is where the random generator is used in a group. This includes commands such as \texttt{\selectrandomly}. For example, if your document contained something like:

\begin{verbatim}
\begin{enumerate}
\selectrandomly{file1}{8}
\item Solve the following:
\begin{enumerate}
\selectrandomly{file2}{4}
\end{enumerate}
\selectrandomly{file3}{2}
\end{enumerate}
\end{verbatim}

Then using versions prior to v3.0 will produce a different set of random numbers since the second \texttt{\selectrandomly} is in a different level of grouping. If you want to ensure that the document produces exactly the same random set with the new version as with the old version, you will need to get and set the random number seed. For example, the above would need to be modified so that it becomes:

\begin{verbatim}
\begin{enumerate}
\selectrandomly{file1}{8}
\item Solve the following:
\newcount\oldseed
\end{verbatim}

\chapter{Random Selection}

\doforrandN{(n)}{(cmd)}{(list)}{(text)}

\begin{verbatim}
\doforrandN{2}{\thisfile}{file1,file2,file3}{\%
\loadrandomproblems{1}{\thisfile}}
\end{verbatim}

\section{Compatibility With Versions Prior to 3.0}

Version 3.0 of the \texttt{probsoln} package completely changed the structure of the package, but the commands described in this section have been provided to maintain compatibility with earlier versions. The only problems that are likely to occur are those where commands are contained within groups. This will effect any commands that are contained in external files that are outside of the arguments to \texttt{\newproblem} and \texttt{\newproblem*}. However, since the external files had to be parsed twice in order to load the problems, this shouldn’t be an issue as adding anything other than problem definitions in those files would be problematic anyway.

The other likely difference is where the random generator is used in a group. This includes commands such as \texttt{\selectrandomly}. For example, if your document contained something like:

\begin{verbatim}
\begin{enumerate}
\selectrandomly{file1}{8}
\item Solve the following:
\begin{enumerate}
\selectrandomly{file2}{4}
\end{enumerate}
\selectrandomly{file3}{2}
\end{enumerate}
\end{verbatim}

Then using versions prior to v3.0 will produce a different set of random numbers since the second \texttt{\selectrandomly} is in a different level of grouping. If you want to ensure that the document produces exactly the same random set with the new version as with the old version, you will need to get and set the random number seed. For example, the above would need to be modified so that it becomes:

\begin{verbatim}
\begin{enumerate}
\selectrandomly{file1}{8}
\item Solve the following:
\newcount\oldseed
\end{verbatim}

\chapter{Random Selection}

\doforrandN{(n)}{(cmd)}{(list)}{(text)}
This is now equivalent to:
\begin{verbatim}
\loadrandomproblems\[
\langle filename\rangle\{\langle n\rangle\}
\end{verbatim}
\foreachproblem\[
\langle filename\rangle\{\PSNitem\thisproblem\endPSNitem
\end{verbatim}
\end{enumerate}

Note that in both the above cases, a new data set is created with the same name as the file name.

12 The Code

12.1 Package Definition
This package requires \LaTeX{2ε}.
\NeedsTeXFormat{LaTeX2e}
Identify this package and version:
\ProvidesPackage{probsoln}[2017/07/10 v3.05 (NLCT)]
Required packages:
\RequirePackage{ifthen}
\RequirePackage{amsmath}
\RequirePackage{etoolbox}

12.2 Package Options
\ifshowanswers Define boolean to determine whether or not to show the solutions. This governs whether the contents of \texttt{onlysolution} and \texttt{onlyproblem} are displayed.
\newif\showanswers
\showanswersfalse
Define synonym for \showanswerstrue
\let\showanswers\showanswerstrue

Define synonym for \showanswersfalse
\let\hideanswers\showanswersfalse

The package option answers displays the solutions.
\DeclareOption{answers}{\showanswerstrue}
The package option noanswers hides the solutions.
\DeclareOption{noanswers}{\showanswersfalse}

Determine whether or not to use default arguments for problems.
\newif\ifusedefaultprobargs
\DeclareOption{usedefaultargs}{\usedefaultprobargstrue}
\DeclareOption{nousedefaultargs}{\usedefaultprobargsfalse}
\usedefaultprobargsfalse

\prob@showdraftlabel
⟨db name⟩⟨label⟩

Used by \useproblem to display data base name and problem label when in draft mode.
\newcommand*{\prob@showdraftlabel}[2]{}

\draftproblemlabel
⟨db name⟩⟨label⟩

Displays the data base name and label.
\newcommand*{\draftproblemlabel}[2][#1,#2]

Draft mode displays the problem label using \draftproblemlabel
\DeclareOption{draft}{%\renewcommand*{\prob@showdraftlabel}[2]{\draftproblemlabel[#1,#2]}}

Final mode:
\ DeclareOption{final}{%\renewcommand*{\prob@showdraftlabel}[2]}

Process package options:
\ProcessOptions
\RequirePackage{xkeyval}
if@prob@fragile Need a conditional to determine whether \texttt{\texttt{long@collect@body}} needs to be aware of verbatim contents.
\setkeys{probsoln}{@prob}{\texttt{fragile}}{true}
\def\ProbSolnFragileExt{vrb}
\def\ProbSolnFragileFile{\jobname}
\newwrite\probsoln@write
\newcount\probsoln@startyear
\def\SetStartYear#1{\probsoln@startyear=#1\relax}
\def\GetStartYear{\probsoln@startyear}
\newcount\probsoln@startmonth
\def\SetStartMonth#1{\probsoln@startmonth=#1\relax\ifnum\month<\probsoln@startmonth\advance\probsoln@startyear by -1\relax\fi}
\def\SetStartMonth{9}
\def\probsoln@prev{\jobname}
19
\texttt{\probsoln@used} File handle for file containing previous used.
\begin{verbatim}
\newwrite\probsoln@used
\end{verbatim}

\probsoln@prev@cutoff Cut-off year. Problems excluded if the year they were set is greater than the cut-off year.
\begin{verbatim}
\newcount\probsoln@prev@cutoff
\end{verbatim}

\probsoln@usedfilename Stores the file name for the used problems file. (Defaults to $\jobname.prb$)
\begin{verbatim}
\newcommand*{\@probsoln@usedfilename}{\jobname.prb}
\end{verbatim}

SetUsedFileName Set the name of the used problems file.
\begin{verbatim}
\newcommand*{\SetUsedFileName}[1]{%
  \renewcommand*{\@probsoln@usedfilename}{#1}%
}
\end{verbatim}

\ClearUsedFile Clear the contents of the used file ($\@probsoln@usedfilename$) and remove corresponding entries from the previous file (as specified in \ExcludePreviousFile). Not to be used after \ExcludePreviousFile.
\begin{verbatim}
\newcommand*{\ClearUsedFile}[1]{%
  \probsoln@prev@cutoff=0\relax
  \@probsoln@readprev{#1}%

  Only write labels that aren't in the used file.
  \%\for\@this@db:=\prob@databases\do{%
    \%\edef\@prev@list{\csname probsoln@prev@list@\@this@db\endcsname}%
    \%\ifdefempty{\@prev@list}{}%
    \%\for\@this@label:=\@prev@list\do{%
      \%\csundef{\@used@problem@\@this@db @\@this@label}%
      \%\immediate\write\probsoln@prev{%
        \string\previousproblem{\@this@label}{\@this@db}%
        {\csname @prev@problem@\@this@db @\@this@label\endcsname}}%
    }%
  }%
  \%\immediate\closeout\probsoln@prev
  \immediate\closeout\probsoln@used
  \@disable@include@prev
}\end{verbatim}

\ExcludePreviousFile Exclude problems used in the last $\langle n \rangle$ years.
\begin{verbatim}
\newcommand*{\ExcludePreviousFile}[2][3]{%
  \for\@this@db:=\prob@databases\do{%
    \for\@this@label:=\@prev@list\do{%
      \csundef{\@used@problem@\@this@db @\@this@label}%
      \immediate\write\probsoln@prev{%
        \string\previousproblem{\@this@label}{\@this@db}%
        {\csname @prev@problem@\@this@db @\@this@label\endcsname}}%
    }%
  }%
}\end{verbatim}
Read contents of previous and used files and open for writing.

\newcommand*{\@probsoln@readprev}[1]{% 
\@enable@exclude@prev
\InputIfFileExists{#1}{% 
\PackageInfo{probsoln}% \Excluded problem file ‘#1’ found}% 
\PackageInfo{probsoln}% \Excluded problem file ‘#1’ not found. A new one will be created}% 
\InputIfFileExists{\@probsoln@usedfilename}{% 
\PackageInfo{probsoln}% \Current problems file ‘\@probsoln@usedfilename’ found}% 
\PackageInfo{probsoln}% \No current problem file ‘\@probsoln@usedfilename’ found. A new one will be created}% 
\immediate\openout\probsoln@prev=#1
\immediate\openout\probsoln@used=\@probsoln@usedfilename
}%

Maintain a list of all previous problem labels:

\newcommand*{\@probsoln@prev@list@default}{}

Write all previous labels to file.

\newcommand*{\@write@prev}{% 
@for\this@db:=\prob@databases\do{% 
\edef\@prev@list{\csname probsoln@prev@list@\this@db\endcsname}% 
@ifempty{\@prev@list}{}% 
% 
@for\this@label:=\@prev@list\do{% 
\immediate\write\probsoln@prev{% 
\string\previousproblem{\@this@label}{\this@db}{\csname @prev@problem@\this@db @\this@label\endcsname}}}% 
}% 
}%
Enable commands for excluding previously selected problems.
\newcommand*{\@enable@exclude@prev}{%}

Redefine macro that adds used problem to used problem file and previous problem file.
\renewcommand*{\@add@used@problem}[2]{%
  \immediate\write\probsoln@used{%\string\usedproblem{##1}{##2}{\number\probsoln@startyear}}%
  \ifcsundef{@prev@problem@##2@##1}{%
    \immediate\write\probsoln@prev{%\string\previousproblem{##1}{##2}{\number\probsoln@startyear}}%
    \expandafter\xdef\csname @prev@problem@##2@##1\endcsname{%\number\probsoln@startyear}%
  }{%}
  \expandafter\ifnum\csname @prev@problem@##2@##1\endcsname<\probsoln@startyear
  \immediate\write\probsoln@prev{%\string\previousproblem{##1}{##2}{\number\probsoln@startyear}}%
  \expandafter\xdef\csname @prev@problem@##2@##1\endcsname{%\number\probsoln@startyear}%
  \fi
}
\}

Redefine macro that fetches the exclusion list. (First argument is the macro in which to store the list, the second argument is the database.)
\renewcommand*{\@fetch@excluded@list}[2]{%
  \def##1{}%
  \ifcsdef{probsoln@prev@list@##2}{%
    \edef\@prev@list{%\csname probsoln@prev@list@##2\endcsname}
    \@for\@this@label:=\@prev@list\do{%
    \ifcsndef{@used@problem@##2@\@this@label}{%
      \ifcsempty{##1}{%\edef##1{\@this@label}}{%\edef##1{##1,\@this@label}}%
      \}
    \}
  }{%
  \}
\}

If it isn’t one of the used problems, it can be added to the exclusion list:
\ifcsndef{@used@problem@##2@\@this@label}{%}
\}

If it isn’t, so label can be added to the exclusion list:
\ifcsempty{##1}{%
  {\edef##1{\@this@label}}%
  {\edef##1{##1,\@this@label}}%
}\}
}
Add new previous list for given database:
\renewcommand*{\@add@newprevlist}{% 
  \expandafter\gdef\csname probsoln@prev@list@##1\endcsname{}% 
}\%

Redefine macro that closes the exclusion-related files.
\renewcommand*{\close@probsoln@prev}{% 
  \closeout\probsoln@prev 
  \closeout\probsoln@used 
}\%
}

\@disable@exclude@prev
Disable commands for excluding previously selected problems.
\newcommand*{\@disable@exclude@prev}{% 
  \renewcommand*{\@add@used@problem}{2}{% 
  \renewcommand*{\@fetch@excluded@list}{2}{\def##1{}% 
  \renewcommand*{\@add@newprevlist}{1}{% 
  \renewcommand*{\close@probsoln@prev}{}% 
}\%

By default, the commands for excluding previously selected problems are disabled.

\add@used@problem
Adds problem to used problems list. (First argument is the label, the second argument is the database name.)
\newcommand*{\@add@used@problem}{2}{% 

\@fetch@excluded@list
Fetches the excluded list. (First argument macro in which to store the list. The second argument is the database name.)
\newcommand*{\@fetch@excluded@list}{2}{\def##1{}% 

\add@newprevlist
Adds a new previous list for the given database:
\newcommand*{\@add@newprevlist}{1}{% 

\close@probsoln@prev
Close file used for previous labels
\newcommand*{\close@probsoln@prev}{}%

At the end of the document, close file if required:
\AtEndDocument{\close@probsoln@prev}

\previousproblem
Identifies problem that has been selected and the year it was selected. (First argument label, second argument database name, third argument year.)
\newcommand*{\previousproblem}{3}{% 
  \ifnum#3>\probsoln@prev@cutoff 
  \probsoln@prev@cutoff \def##1{}% 
}\%

If data set hasn’t been defined, define it:
\ifsundef{prob@db@#2}{\prob@newdb{#2}}{}%
Define command that stores the year the problem was used:
\expandafter\gdef\csname @prev@problem@#2@#1\endcsname{#3}\%

Add label to the previous list for this data set:
\edef\@prev@list{\csname probsoln@prev@list@#2\endcsname}\%
\ifdefempty{\@prev@list}\%
{\expandafter\xdef\csname probsoln@prev@list@#2\endcsname{#1}\%}
{\expandafter\xdef\csname probsoln@prev@list@#2\endcsname{\@prev@list,#1}\%}
\fi

\usedproblem

Don’t want to exclude problems that were selected in the previous run of this document for the current year, so they need to be identified in the aux file.
\newcommand*{\usedproblem}[3]{\ifnum#3=\probsoln@startyear\expandafter\def\csname @used@problem@#2@#1\endcsname{#3}\fi}

12.3 Databases

All the problems are stored in data bases. Each data base (name) is represented as a macro \prob@db@(name) which stores a comma-separated list of labels for each problem associated with that data base. Each problem (label) is stored in the macro \prob@data@(name)@(label). Problems loaded from an external file using \loadproblems are added to the specified data base. Any problems that are defined in the document or are \inputed from another file (without the use of \loadproblems) are added to the default data base.

Define the default data base:
\newcommand*{\prob@db@default}{\}

\prob@databases
Store a list of all the defined data bases.
\newcommand*{\prob@databases}{default}\}

Each defined database has a list of undisplayed solutions.
\newcommand*{\prob@ddefault@solutions}{\}

\prob@newdb

\prob@newdb{(name)}

Creates a new (empty) data base.
Keep a track of the current data base
\newcommand*{\prob@currentdb}{default}

\moveproblem \moveproblem{(label)}{(source)}{(target)}

\moveproblem{(label)}{(source)}{(target)}

Moves problem identified by \textit{(label)} from the data base \textit{(source)} to the data base \textit{(target)}. (Doesn't remove label from \textit{(source)} — that needs to be done separately.)

Add label to target data base
\ifcsempty{prob@db@#3}{}

25
Redefine \prob@data@⟨source⟩@⟨label⟩ as \prob@data@⟨target⟩@⟨label⟩.

\edef\do@movedata{%
\noexpand\global\noexpand\let\expandafter\noexpand\csname prob@data@#3@#1\endcsname=%
\expandafter\noexpand\csname prob@data@#2@#1\endcsname
\noexpand\global\noexpand\let\expandafter\noexpand\csname prob@data@#2@#1\endcsname=\noexpand\undefined
}\do@movedata

Redefine \prob@argN@⟨source⟩@⟨label⟩ as \prob@argN@⟨target⟩@⟨label⟩.

\edef\do@moveargN{%
\noexpand\global\noexpand\let\expandafter\noexpand\csname prob@argN@#3@#1\endcsname=%
\expandafter\noexpand\csname prob@argN@#2@#1\endcsname
\noexpand\global\noexpand\let\expandafter\noexpand\csname prob@argN@#2@#1\endcsname=\noexpand\undefined
}\do@moveargN

Redefine \prob@args@⟨source⟩@⟨label⟩ as \prob@args@⟨target⟩@⟨label⟩, if defined.

\@ifundefined{prob@args@#2@#1}{}{%
\edef\do@moveargs{%
\noexpand\global\noexpand\let\expandafter\noexpand\csname prob@args@#3@#1\endcsname=%
\expandafter\noexpand\csname prob@args@#2@#1\endcsname
\noexpand\global\noexpand\let\expandafter\noexpand\csname prob@args@#2@#1\endcsname=\noexpand\undefined
}\do@moveargs
}\%

12.4 Defining New Problems

\prob@newproblem{(n)}{(db name)}{(label)}{(definition)}{(default args)}

Define a new problem identified by ⟨label⟩ for data base ⟨db name⟩ with the given definition. The problem has ⟨n⟩ arguments (each represented by #1 etc). The arguments may either be appended to \useproblem{(label)} or may be stored in \prob@args@⟨db
If the problem is to be accessed via \foreachproblem. The number of arguments is stored in \prob@argN@. The number of arguments is stored in \prob@argN@. If the given data base is not defined, create it:
\@ifundefined{prob@db@#2}{\prob@newdb{#2}}{
Check whether this entry has already been defined:
\@ifundefined{prob@data@#2@#3}{
Define the new problem and make it global:
\let\@tmp=\undefined
\newcommand\@tmp[#1]{#4}
\expandafter\global\expandafter\let\csname prob@data@#2@#3\endcsname=\@tmp
\let\@tmp=\undefined
Add the label to the data base:
\expandafter\ifx\csname prob@db@#2\endcsname\@empty
\expandafter\xdef\csname prob@db@#2\endcsname{#3}
\else
\expandafter\xdef\csname prob@db@#2\endcsname{\csname prob@db@#2\endcsname,#3}
\fi
If default arguments supplied, set them
\ifx\@empty#5\@empty
\else
\edef\thisprob@currentdb{#2}
\edef\thisprob@currentlabel{#3}
\expandafter\@setdefaultprobargs\expandafter{#5}
\fi
\PackageError{probsoln}{Problem ‘#3’ is already defined for data base ‘#2’}{Problem labels must be unique for each data base}
\}%
\}%
\prob@gobblethree Ignore all three arguments
\newcommand{\@prob@gobblethree}[3]{}
\@prob@getargs \@prob@getargs(n){\db name}(label)
Prompt user for \(n\) arguments for problem \(\textit{label}\) in data base \(\textit{db name}\).
Please specify (e.g. \csname @prob@getargs@eg@\romannumeral#1\endcsname):}%
\read-1to\@tmp
\expandafter\global\expandafter\let
\csname prob@args@#2@#3\endcsname=\@tmp
\def\@prob@getargs@eg@i{{12}}
\def\@prob@getargs@eg@ii{{5}{3}}
\def\@prob@getargs@eg@iii{{4}{5}{2}}
\def\@prob@getargs@eg@iv{{5}{3}{10}{8}}
\def\@prob@getargs@eg@v{{5}{3}{10}{8}{4}}
\def\@prob@getargs@eg@vi{{5}{3}{10}{8}{4}{24}}
\def\@prob@getargs@eg@vii{{5}{3}{10}{8}{4}{24}{32}}
\def\@prob@getargs@eg@viii{{5}{3}{10}{8}{4}{24}{32}{9}}
\def\@prob@getargs@eg@ix{{5}{3}{10}{8}{4}{24}{32}{9}{2}}
\@prob@do@getargs
\let\@prob@do@getargs\@prob@gobblethree
\setprobargs
\setprobargs{⟨db name⟩}{⟨label⟩}{⟨args⟩}
Sets the arguments for the given problem. Each of the arguments within ⟨args⟩ should
be grouped, e.g. \setprobargs{label}{{5}{3}}. Inner braces are still required if there
is only one argument, e.g. \setprobargs{label}{{25}}
\newcommand*{\setprobargs}[3][default]{%  
\expandafter\gdef\csname prob@args@#1@#2\endcsname{#3}-%}
\@setdefaultprobargs
Like \setprobargs but only sets the arguments if \usedefaultprobargstrue. The
database is given by \thisprob@currentdb (the current database) and the problem
label is given by \thisprob@currentlabel. This command should only be used within
defproblem.
\newcommand*{\setdefaultprobargs}[1]{%  \ifusedefaultprobargs%
\setprobargs{\thisprob@currentdb}{\thisprob@currentlabel}{#1}%
\fi%
}
\long@collect@body
Need long versions of \collect@body. These macros are adapted from the macros
defined by amsmath.
\long\def\long@collect@body#1{%  \@envbody{\@xp#1\@xp{\the\@envbody}}%
  \edef\process@envbody{\the\@envbody\end{\@currenvir}%
  \@envbody\@emptytoks \def\begin@stack{b}%
  \begingroup
  \if@prob@fragile%
    \obeylines\obeyspaces
  \fi%
Fragile contents are sanitized, written to file and read back in. However, we don’t want the new line character sanitized. Also, the `verbatim` environment doesn’t like a space after `\begin` or `\end`, so these need to be replaced.

First define a macro that contains the newline marker:

```latex
\def\@char@M{\char\endline}
```

Define a macro that contains the `begin` environment marker:

```latex
\def\@beg@env@string{\begin}
```

Define a macro that contains the end environment marker:
\def\@end@env@string{\end}
\@onelevel@sanitize\@end@env@string

Things start to get a bit complicated here. The substitution macros need the markers as part of their definition. The easiest way to do this is to define a command (using \edef) that defines the substitution macros. The markers and replacements are the only things to be expanded.
\edef\def@replace@markers{%
First define the command that replaces the newline marker:
\noexpand\def\noexpand\dore@replace@charM##1\@char@M##2\noexpand\end@replace@marker{%
\noexpand\expandafter\noexpand\toks@\noexpand\expandafter{\noexpand\replace@text}%
\noexpand\if\noexpand\expandafter\noexpand\relax\noexpand\noexpand\expandafter\noexpand\relax
\noexpand\edef\noexpand\replace@text{\noexpand\the\noexpand\toks@\noexpand\relax}
\noexpand\let\noexpand\do@replacenext\noexpand\replace@mark@noop
\noexpand\else
\noexpand\edef\noexpand\replace@text{\noexpand\the\noexpand\toks@\noexpand\string\noexpand\charM
\noexpand\expandafter\noexpand\gobble\noexpand\string\noexpand\begin}%
\noexpand\let\noexpand\do@replacenext\noexpand\do@replace@charM
\noexpand\fi
\noexpand\do@replacenext##2\noexpand\end@replace@marker
%
Next define the command that replaces the begin environment marker:
\noexpand\def\noexpand\dore@replace@begverb##1\@beg@env@string##2\noexpand\end@replace@marker{%
\noexpand\expandafter\noexpand\toks@\noexpand\expandafter{\noexpand\replace@text}%
\noexpand\if\noexpand\expandafter\noexpand\relax\noexpand\noexpand\expandafter\noexpand\relax
\noexpand\edef\noexpand\replace@text{\noexpand\the\noexpand\toks@\noexpand\begin}%
\noexpand\let\noexpand\do@replacenext\noexpand\dore@replace@begverb
\noexpand\fi
\noexpand\do@replacenext##2\noexpand\end@replace@marker
%
Next define the command that replaces the end environment marker:
\noexpand\def\noexpand\dore@replace@endverb##1\@end@env@string##2\noexpand\end@replace@marker{%
\noexpand\expandafter\noexpand\toks@\noexpand\expandafter{\noexpand\replace@text}%
\noexpand\if\noexpand\expandafter\noexpand\relax\noexpand\noexpand\expandafter\noexpand\relax
\noexpand\edef\noexpand\replace@text{\noexpand\the\noexpand\toks@\noexpand\end}%
\noexpand\let\noexpand\do@replacenext\noexpand\dore@replace@endverb
\noexpand\fi
\noexpand\do@replacenext##2\noexpand\end@replace@marker
%
Finally, define a higher-level command that calls all three of the above:

\noexpand\def\noexpand\replace@markers##1{%  
\noexpand\def\noexpand\replace@text{}%
\noexpand\expandafter\noexpand\do@replace@charM##1\@char@M\relax\noexpand\end@replace@marker
\noexpand\let##1\noexpand\replace@text
\noexpand\def\noexpand\replace@text{}%
\noexpand\expandafter\noexpand\doreplace@begverb##1\@beg@env@string\relax\noexpand\end@replace@marker
\noexpand\let##1\noexpand\replace@text
\noexpand\def\noexpand\replace@text{}%
\noexpand\expandafter\noexpand\doreplace@endverb##1\@end@env@string\relax\noexpand\end@replace@marker
\noexpand\let##1\noexpand\replace@text
}

Define the substitution loop terminator:

\def\replace@mark@noop#1\end@replace@marker{}

Now define all the marker substitution macros:

\def\replace@markers

defproblem
\begin{defproblem}[(n)][(default args)][(label)][(key-val options)]

Define a new problem identified by (label) with (n) arguments to add to the current data base. Note that since the contents of the environment are passed to a command, the contents can’t contain any verbatim text.

\newenvironment{defproblem}[1][0]{%  
\edef\@prob@currentargN{\number0#1}%
@defproblem@beginenv
}{%  
\@defproblem@beginenv@
}
% \end{macrocode}
% Gather second optional argument and mandatory argument:
% \begin{macrocode}
\newcommand*{\@defproblem@beginenv@}[1][]{%  
\setkeys{probsoln}{#1}%  
\long@collect@body\prob@do@defproblem
}
% Get final optional argument and process
\newcommand*{\prob@do@newproblem}[1][]{%  
\setkeys{probsoln}{#1}%  
\long@collect@body\prob@do@defproblem
Defines a new problem given by \langle \textit{definition} \rangle, where the number of arguments is given by \prob@currentargN, the label is given by \prob@currentlabel and the data base is given by \prob@currentdb.

\newcommand{\prob@do@newproblem}[1]{% 
  \if\prob@fragile 
  \probsoln@process@fragile{#1}% 
  \protected@edef\do@def@new@problem{% 
    \noexpand\prob@newproblem 
    {\prob@currentargN}% 
    {\prob@currentdb}% 
    {\prob@currentlabel}% 
    {\noexpand\probsoln@write@tmp{\prob@tmp@problem}% 
    \noexpand\probsoln@read@tmp}% 
    {\prob@currentdefaultargs}% 
  }% 
  \else 
  \toks@{#1}% 
  \protected@edef\do@def@new@problem{% 
    \noexpand\prob@newproblem 
    {\prob@currentargN}% 
    {\prob@currentdb}% 
    {\prob@currentlabel}% 
    {\the\toks@}% 
    {\prob@currentdefaultargs}% 
  }% 
  \fi 
  \do@def@new@problem 
}\prob@do@defproblem

The default action of the \texttt{defproblem} environment is to define a new problem.

\let\prob@do@defproblem=\prob@do@newproblem

\texttt{onlysolution} Define an environment that only displays its contents if the solutions should be displayed.

\newenvironment{onlysolution}[1][]{% 
  \setkeys{probsoln}{#1}% 
  \long@collect@body\do@onlysolution 
}{
\do@onlysolution

\newcommand{\do@onlysolution}[1]{% 
  \ifshowanswers 
  \probsoln@do@body{#1}% 
  \fi 
  Add to the list of solutions 
  \if\undefined{\prob@currentlabel} 
  {\% 
  \else 
  \fi

32
Globally adds label to list if not already in list.
\newcommand*{\psn@add@unique@label}{\ifx#1\@empty\xdef#1{#2}\else\edef\@tmp@label{#2}\expandafter\DTLifinlist\expandafter{\@tmp@label}{#1}\%\ignore{\xdef#1{#1,\@tmp@label}}\fi\}%\end{macro}
\begin{macro}{\DTLifinlist}\% This is defined in \sty{datatool}, but there's no sense loading\% the entire package just for this, so define if not already\% defined.\changes{3.01}{2011/08/22}{new}\begin{macrocode}\providecommand{\DTLifinlist}{\def\@dtl@doifinlist##1,#1,##2\end@dtl@doifinlist{\def\@before{##1}\def\@after{##2}\expandafter\@dtl@doifinlist\expandafter,#2,#1,\@nil\end@dtl@doifinlist}\ifx\@after\@nnil\% not found\else\% found\fi}
\end{macrocode}\end{macro}

onlyproblem Define an environment that only displays its contents if the solutions should not be
12.5 Using Problems

\begin{useproblem}[db name]{label}{arg1}...{argN}
Use problem identified by \langle label \rangle in data base \langle db name \rangle where \langle arg1 \ldots argN \rangle are the arguments to pass to the problem, if the problem was defined to take arguments.

\newcommand{\useproblem}[2][default]{%  
def\@prob@currentlabel{#2}%  
def\prob@currentdb{#1}%  
\prob@showdraftlabel{#1}{#2}%  
@add@used@problem{#2}{#1}%  
let\useprob@next=\relax  
@ifundefined{prob@data@#1@#2}%

### 12.6 Loading Problems From Another File

\loadallproblems{\langle db name \rangle}{\langle filename \rangle}

Loads all the problems defined in \langle filename \rangle and adds them to data base \langle db name \rangle. (\par is temporarily disabled to allow for blank lines between problems.)

\newcommand*{\loadallproblems}[2][default]{%  \bgroup  \let\par\relax  \edef\prob@currentdb{#1}%  \input{#2}%  \egroup}

\prob@do@selectedproblem Only define problem if the label is listed in \prob@selectedlabels. (The current label is given by \@prob@currentlabel.)

\newcommand{\prob@do@selectedproblem}[1]{%  \expandafter\DTLifinlist\expandafter{\@prob@currentlabel}{\prob@selectedlabels}{%  \%  \prob@do@newproblem{#1}%  \}  
\}%

\loadselectedproblems{\langle db name \rangle}{\langle list \rangle}{\langle filename \rangle}
Loads only those problems whose labels are listed in \textit{list}.
\newcommand{\loadselectedproblems}[3][default]{%
  \bgroup
  \let\par\relax
  \edef\prob@currentdb{#1}%
  \edef\prob@selectedlabels{#2}%
  \let\prob@do@defproblem=\prob@do@selectedproblem
  \input{#3}%
  \egroup
}

\prob@do@exceptedproblem
Only define problem if the label isn’t listed in \texttt{\prob@selectedlabels}. (The current label is given by \texttt{\@prob@currentlabel}.)
\newcommand{\prob@do@exceptedproblem}[1]{%
  \expandafter\DTLifinlist\expandafter{\@prob@currentlabel}{\prob@selectedlabels}{}
%
  \prob@do@newproblem{#1}
%
%
}

\loadexceptproblems\loadexceptproblems[\texttt{db name}]{\texttt{list}}{\texttt{filename}}

Loads only those problems whose labels are not listed in \textit{list}.
\newcommand{\loadexceptproblems}[3][default]{%
  \bgroup
  \let\par\relax
  \edef\prob@currentdb{#1}%
  \edef\prob@selectedlabels{#2}%
  \let\prob@do@defproblem=\prob@do@exceptedproblem
  \input{#3}%
  \egroup
}

\prob@add@currentlabel
Adds the current label to \texttt{\prob@selectedlabels} (ignores argument.)
\newcommand{\prob@add@currentlabel}[1]{%
  \ifx\prob@selectedlabels\@empty
    \xdef\prob@selectedlabels{\@prob@currentlabel}%
  \else
    \xdef\prob@selectedlabels{\prob@selectedlabels,\@prob@currentlabel}%
  \fi
%
}

\iffirstpass
Determines if this is the first pass of the filename when loading a data base.
\newif\iffirstpass
\firstpasstrue
\loadrandomproblems[(db name)]{(n)}{(filename)}

Loads \(n\) randomly selected problems from \((filename)\).

\newcommand{\loadrandomproblems}[3][default]{%  
  \@fetch@excluded@list{\@excl@list}{#1}%  
  \@loadrandomproblems{#1}{#2}{#3}{\@excl@list}%}

\loadrandomexcept

\loadrandomexcept[(db name)]{(n)}{(filename)}{(exception list)}

Loads \(n\) randomly selected problems from \((filename)\), excluding labels listed in \((exception list)\).

\newcommand{\loadrandomexcept}[4][default]{%  
  \@loadrandomproblems{#1}{#2}{#3}{#4}%}

\@loadrandomproblems

Internal workings of \loadrandomproblems and \loadrandomexcept. Needs to input \((filename)\) twice: the first time just gathers all the labels, the second time only loads the selected problems.

\newcommand{\@loadrandomproblems}[4]{%  
  \bgroup

\global\r@ndcur = \@ps@randtmp 
\ifnum\r@ndcur=0\relax 
\global\r@ndcur=1\relax 
\fi 
} 
\PSNuseoldrandom Use the old random number generator 
\newcommand*{\PSNuseoldrandom}{% 
\let\PSNrand=\PSN@old@rand 
} 
\PSNrandom {\PSNrandom{(count)}{(n)}
stores a random number from 1 to $n$ in the TeX count register $\langle count \rangle$.

```
\newcommand{\PSNrandom}[2]{%
  generate new random number.
  \PSNrand
  #1=\r@ndcur
  \@ps@randtmp=\r@ndcur
  now set $\langle count \rangle$ to $(\langle count \rangle \mod \langle n \rangle) + 1$
  \divide\@ps@randtmp by #2\relax
  \multiply\@ps@randtmp by #2\relax
  \advance#1 by -\@ps@randtmp
  \advance#1 by 1\relax
}
```

```
\random{\langle counter\rangle}{\langle a \rangle}{\langle b \rangle}
```

Generate a random number in the range $[a, b]$, and store this number in the LATEX counter $\langle counter \rangle$.

```
\newcommand{\random}[3]{%
  ifnum#2=1\relax
  \PSNrandom{\value{#1}}{#3}\
  \else
  \@rndselctr=#3\%
  \advance\@rndselctr by -#2\relax
  \advance\@rndselctr by 1\relax
  \PSNrandom{\value{#1}}{\@rndselctr}\%
  \addtocounter{#1}{\@rndselctr}\%
  \addtocounter{#1}{-1}\%
  \fi
}
```

```
\shuffle
```

Shuffle contents of pseudo-array. For example, suppose you have the following definitions: \def{fooi}{A}, \def{fooii}{B} and \def{fooiii}{C}, then \shuffle{foo}{3} will shuffle the definitions, so you may end up with, e.g. \def{fooi}{C}, \def{fooii}{A}, \def{fooiii}{B}, or some other variation.

```
\newcount@shfctr \newcount@shfA \newcount@shfB
\newcommand{\shuffle}[2]{%
  @shfctr=1\relax
  \whiledo{@shfctr < 101}%
  {% 
    \PSNrandom{\@shfA}{#2}\PSNrandom{\@shfB}{#2}\%
    \ifnum@shfA=@shfB\%
    \else
      \edef@@tmpA{\csname#1\romannumeral@shfA\endcsname}\
      \let@@tmpA=@@tmpA
      \edef@@tmpB{\csname#1\romannumeral@shfB\endcsname}\
      \let@@tmpB=@@tmpB
      \edef@@tmpA{\csname#1\romannumeral@@tmpA\endcsname}\
      \let@@tmpA=@@tmpA
      \edef@@tmpB{\csname#1\romannumeral@@tmpB\endcsname}\
      \let@@tmpB=@@tmpB
    \fi
  }
}
```

42
A bit like \for but only for a random subset of the given list. For example, the following will load one problem each from two out of the three listed files.

\doforrandN{2}{\tmp}{file1, file2, file3}{\\loadrandomproblems{1}{\tmp}}

\newcount\ps@forrand
\newcount\ps@forrand@level
\newcommand\doforrandN[4]{\%
  \global\advance\ps@forrand@level by 1\relax
  \ifsnum\ps@forrand<#1\relax
    \PackageError{probsoln}{Can't randomly select \string\number\ps@forrand\space item(s)}{You have requested \string\number\ps@forrand\space item(s), but there are only \string\number\ps@forrand\space item(s) in the list: #3}\%
  \else
    \shuffle{\doforrandN[0]{\ps@forrand@level}{\ps@forrand}}{\ps@forrand@level}{\ps@forrand\hash}\%\ifsnum\ps@forrand>0\relax
      \ps@forrand=0\relax
      \loop
        \advance\ps@forrand by 1\relax
        \edef#2{\csname \doforrandN[0]{\ps@forrand@level}{\ps@forrand}}\%\ifsnum\ps@forrand<#1\relax
          \repeat
      \fi
    \fi
  \fi}
\global\advance\ps@forrand@level by -1\relax
}

12.9 Compatibility With Older Versions

These commands ensure that this version is compatible with versions prior to v3.0
12.10 Formatting Commands

These commands are provided to format parts of the problems/solutions.

```latex
\@ifundefined{solution}{{% 
  \newenvironment{solution}{\par\noindent\textbf{\solutionname}: \space \ignorespaces}{}%
}{}%}
\solutionname
\newcommand*{\solutionname}{Solution}

Define an in-line enumeration which uses the enumeration environment’s counters.

```latex
\newenvironment{textenum}{% 
  \ifnum\@enumdepth>\thr@@ 
  \@toodeep
  \else 
  \advance\@enumdepth by 1\relax
  \edef\@enumctr{enum\romannumeral\the\@enumdepth}\%
  \let\@item\@textitem
  \def\@itemlabel{% 
    \refstepcounter{\@enumctr}%
    \csname label\@enumctr\endcsname \%
    \setcounter{\@enumctr}{0}%
  \fi
  \ignorespaces 
}{}%}
\@textitem In-line enumeration item
\def\@textitem[#1]{{#1\space\ignorespaces}}
\correctitemformat Indicates how to format the item label for \correctitem when the solutions are shown.
The argument is the label. This defaults to placing the argument in a box.
\newcommand*{\correctitemformat}[1]{{#1}\fbox{#1}}
\incorrectitemformat Indicates how to format the item label for \incorrectitem when the solutions are shown.
The argument is the label. This defaults to just the argument shifted by \fboxsep +\fboxrule to ensure it aligns with the default \correctitemformat.
\newcommand*{\incorrectitemformat}[1]{{% 
  \hspace{\fboxsep}\hspace{\fboxrule}\#1}}
```
\correctitem This can be used instead of \item. If the solutions are not shown, it behaves like \item, otherwise, it’s like \item, but the label is formatted according to \correctitemformat.
\newcommand*{\correctitem}{\@inmatherr\correctitem \@ifnextchar[\@correctitem[@noitemmargtrue@correctitem[@itemlabel]]}
\def@correctitem[#1]{% 
\ifshowanswers
 \item[@correctitemformat[#1]]% 
\else
 \item[#1]% 
\fi}

\incorrectitem This can be used instead of \item. If the solutions are not shown, it behaves like \item, otherwise, it’s like \item, but the label is formatted according to \incorrectitemformat.
\newcommand*{\incorrectitem}{\@inmatherr\incorrectitem \@ifnextchar[\@incorrectitem[@noitemmargtrue@incorrectitem[@itemlabel]]}
\def@incorrectitem[#1]{% 
\ifshowanswers
 \item[@incorrectitemformat[#1]]% 
\else
 \item[#1]% 
\fi}
Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the definition; numbers in roman refer to the pages where the entry is used.
