1 Introduction

Since the appearance last year of \TeXmate in its first version, the \LaTeX-chess community has been very active. Now there are new versions of Torben Hoffmann’s \texttt{skak} and of its fonts. There are new packages of immense scope and utility: Ulrike Fischer’s \texttt{chessfss} and \texttt{chessboard}.

To an important degree, all these efforts have grown together. And \TeXmate now incorporates the chess-playing capabilities of \texttt{skak}, somewhat achieving what back in the day was a dream of having the best of both worlds, a dream that arose from the enthusiastic reception of the first \TeXmate. Now \TeXmate uses \texttt{skak} to follow the game, helping to catch input mistakes, and, above all, drawing the diagram of the current position automatically. In addition, font handling is completely delegated to \texttt{chessfss}, and for now all packages appear to be satisfactorily compatible.

My thanks then to Ulrike and Torben, but also Ulrich Dirr, for their constant interest and feedback. I am indebted for the final encouragement to Frank Mittelbach as well.

Future plans include a \texttt{PGN-to-\TeX} translator. As for \TeXmate, it’s probably too early to know where it’s going, but one thing seems clear: \TeXmate might interfere with other complicated packages. The problem lies in the change of category codes for some characters. This is certainly something to look into. (Quick and dirty try, though: modify \texttt{\@nochesscodes} according to the other packages you are loading...)
2 Basic usage

2.1 A short game

| 1 e4 e5 Nf3 Nc6 Bc4 Bc5 0-0 d6 d3 Nf6 Bg5 |
| h6 Bh4 g5 Bg3 h5 Nxg5 h4 Nxf7 hxg3 |
| Nxd8 Bg4 Qe1 Nd4 Nc3 Nf3+ gxf3 Bxf3 |

This input stream gives \TeX{}mate the moves of a beautiful miniature (probably home-prepared, though) by Steinitz.

The only two conventions are the inclusion of all moves between two |'s ("chess mode"), and the separation of moves by spaces. Beyond that, the user is free to add punctuation marks, as inconsistently as he wants, and \TeX{}mate will always produce the same output. (In particular, PGN move notation is supported without any change.)

In normal conditions, the | is set by default to delimit chess mode.

The user commands \makebarother and \makebarchess toggle the \makebarchess meaning of that character between chess mode and nothing special.

However, if \TeX{}mate finds that another package has a special use for |, it will refrain from using it. In that case, chess mode should be entered with through an alternative (which is always available, in any case): the \textmate environment (\begin{textmate}–\end{textmate}). Even then, a \makebarchess (by the user) will make | open and close chess mode.

With default settings, the result of the quoted input is:

1. e4 e5 2. d3 f3 3. c4 c5 4. d3 f6 5. g5 d6 6. 0–0 h6 7. h4 g5 8. g3 h5 9. g5 f4 10. g7 h4 11. g8 d8 h6 12. e1 d4 13. c3 f3+ 14. gxf3 f3

And White cannot avoid being mated.

2.2 Game title

The game was played between Dubois and Steinitz in London in 1862. So:

\whitename{Dubois} \\
\blackname{Steinitz} \\
\chessevent{London 1862}
\ECO{C50}
\chessopening{Giucco Pianissimo}

\welo \belo (\chessevent is a safer command name than ‘place,’ and for games of chess, they are usually interchangeable.) All these commands are not required, and there are two more: \welo and \belo for ratings or other information about the players.

Now, before the game is input, we can issue \makegametitle. If in addition we type \resigns when its White’s turn (so the game input is |1 e4 e5 Nf3...Bxf3 \resigns|), the result is:

\begin{center}
\begin{tabular}{ll}
□ & Dubois \\
■ & Steinitz \\
\end{tabular}
\end{center}

Dubois London 1862
Steinitz Giucco Pianissimo – C50

1. e4 e5 2. \Qf3 \Qc6 3. \Qc4 \Qc5 4. d3 \Qf6 5. \Qg5 d6 6. 0–0 h6 7. \Qh4 g5 8. \Qg3 h5 9. \Q\times g5 h4 10. \Q\times f7 h\times g3 11. \Q\times d8 \Qg4 12. \Qe1 \Qd4 13. \Qc3 \Qf3 14. g\times f3 \Q\times f3 0:1

\newgame \makegametitle includes the all-important command \newgame, that sets the stage for \TeXmate (and skak) to start a game afresh. It is the safest way to start from scratch (for example, for quoting a related game in commentary) if there is no interest in the game title as defined in \TeXmate. (See also sections 3.6 and 4)

2.3 Basic Annotations

Here we will add more things:

Symbols after the moves: !, ?, etc. These pose no complication at all—\TeXmate treats them as part of moves, just as if they were letters. The same applies to chess symbols like \betteris, or \onlymove.

\threat Simple threats with the command \threat<\textit{threat}>. \TeXmate inserts the symbol Δ and typesets the \textit{threat} without regard to move numbers, etc.

[ Variations with the ‘commentary’ markers [ and ].

0 : 1

2.4 Diagrams

\TeXmate 2 makes use of the chess engine of the package \textit{skak} to ‘follow’
the game as it is input, so that it can, at any point, insert a diagram
with the current position. This can be done simply by \textit{skak}’s command
\texttt{\showboard}. At this very moment, the final position of the game is
in memory, so, in a paragraph by itself, the command will produce:

![Diagram](image)

All \textit{skak} commands apply. For example, \texttt{\showonlypanws\showboard}
produces:
\TeXmate provides tools for the handling of diagrams. \texttt{\textbackslash toD} (meaning something like “refer to Diagram”) inserts ‘(D)’ in the chess text, and saves the position in memory. Many positions (by default 3, but extendable) can be held in memory, and they are actually typeset by the command \texttt{\textbackslash makediagrams}.

\texttt{\textbackslash toD} has an argument: the last move. \TeXmate will typeset the last move and put it (by default) below the diagram. Note that it will \textit{not} typeset the move directly in the running chess text (thus the move can be different in running text—where it can have annotation symbols—and in the diagram).

Adding this to the game, the complete input is:

\verbatim
\whitename{Dubois}
\blackname{Steinitz}
\chessevent{London 1862}
\ECO{C50}
\chessopening{Giucco Pianissimo}

\makegametitle
1 e4 e5 Nf3 Nc6 Bc4 Bc5 d3 Nf6 Bg5?! [Nc3] d6 0-0?! h6 Bh4 g5 Bg3 h5! Nxc5 h4! Nxf7 hgx3!! \texttt{\textbackslash toD{hxg3!!}} Nxd8 [Nhx8 Qe7! \texttt{\textbackslash threat<Qh7>} Nf7 Bxf2+ Rxf2 gxg2+ Kg1 Rg1+ Kh1 Rxh1+ gxh1 Bf3\#] Nf3+! gxg3 Bxf3 \texttt{\textbackslash toD{Bxf3}} \texttt{\textbackslash resigns}

\begin{figure}
\makediagrams
\end{figure}

And the complete output is:
1. e4 e5 2. Qf3 c6 3. c4 c5 4. d3 Qf6 5. Qg5?! [5. c3] 5...d6 6. 0–0?! h6 7. Qh4 g5 8. Qg3 h5! 9. Qxg5 h4! 10. Qxf7 h×g3!! (D) 11. Q×d8 [11. Q×h8 W×e7! Δ W×h7 12. Qf7 Δ×f2+ 13. Δ×f2 g×f2+ 14. W×f2 Qg4+ 15. g×g3 W×f6 16. W×f3 W×g7++]

11...Qg4 12. W×e1 Q×d4 13. Qc3 [13. h3 Q×e2+ 14. W×h1 Δ×h3+ 15. g×h3 Δ×f3#] 13...Qf3+! 14. g×f3 Q×f3 (D) 0:1

This will insert the diagrams at a reasonable (in \LaTeX-insertion scales) place. The appearance of the diagrams can be customized to some extent, as treated in section 3.5 \makediagrams will center the diagrams automatically, so \begin{center} is not necessary.

\begin{tobydiagram*}
On the other hand, the starred \texttt{\begin{tobydiagram*}(last move)} will not insert “(D)”, but will otherwise do the same as \texttt{\begin{tobydiagram}.}

\begin{preparediagram}
There is an alternative way of preparing a diagram for typesetting:
\begin{preparediagram}{(diagram header)}{(diagram footer)}\end{preparediagram}

sends the current position into diagram cache, not with the usual header and footer (which by default are the players’ names and the last move, as explained in section 3.5), but with those set directly by the user. This can be done at any point, but it is useful particularly in connection with \texttt{\begin{position} (section 2.10)}.
2.5 Text and chess

Regular, running text can be inserted at any point into a game, by simply exiting chess mode and entering it before the game resumes.

\whitename{Dubois}

□ Dubois
■ Steinitz

London 1862
Giucco Pianissimo – C50

1. e4 e5 2. Qf3 Qc6 3. a4 Qc5 4. d3 Qf6 5. Qg5?! [5. Qc3] 5...d6 6. 0–0?! Black has not yet castled, so he can storm with the Kingside pawns, taking advantage of the aggressive but unfortunate position of White’s bishop. 6...h6 7. h4 g5 8. h5! 9. Qxg5 h4! 10. Qxf7 hxg3!! 11. Qxd8 [11. Qxh8 Qe7! \威胁{Qh7} 12. f7 h6 xf2+ 13. h6 gxf2+ 14. gxf2 Qg4+ 15. Qg3 Qf6 16. Qf3 Qg7--] 11...Qg4 12. We1 Qd4 13. Qc3 [13. h3 Qc2+ 14. Qh1 h6 xh3+ 15. g6 hx3 \#] 13...Qf3+! 14. gxf3 Qxf3 0:1

2.6 Text and annotation

When text and annotation (chess variations that are not the main line of the game) are used at the same time, the symbol ‘[’, inserted by default for variations, can be redundant. We don’t want something like “5. Qg5?! [The development of the Knight with 5. Qc3 is more
urgent. ] 5...d6.

But exiting and re-entering chess mode is not enough, for \TeXmate needs to know that this is a variation (otherwise it will typeset \textit{Nc3} as belonging to the game, and \texttt{skak} will try to update the board and get confused).

The solution is to open the annotation not with the commentary character, but with the commentary \texttt{control sequence: \[}. Thus:

\begin{verbatim}
1e4 e5 Nf3 Nc5 Bc4 Bc5 d3 Nf5 Bg5?!
\[ The development of the Knight with \textit{Nc3} is more urgent. \]
d6...
\end{verbatim}

which produces:

\begin{verbatim}
1. e4 e5 2. Qf3 Qc5 3. Qc4 Qc5 4. d3 Qf5 5. Qg5?! The development of the Knight with 5. Qc3 is more urgent. 5...d6...
\end{verbatim}

\section{Variations and subvariations}

Variations and subvariations, marked by either \texttt{[\langle variation\rangle]} or \texttt{[(\langle variation\rangle)\]}], can be nested (however, [ should always be closed by ], and \] by \}. \TeXmate has four levels of variation (the first being the main game itself), each with its own conventions of font, signs, etc.

So, for example, here is a deeper annotation to White’s move 11, achieved by nesting variations (the relevant input is “Nxd8 [Nxd8 Qe7! [Bg4? Qd2 Nd4 Nc3 Qe7 Qh6\textbackslash WBetter] Nf7 Bxf2+ Rxf2 gxf2+ Kxf2 Ng4+ Kg3 Qf6 Qf3 Qg7\textbackslash BBetter] Bg4”):

\begin{center}

\textbullet & Dubois \hfill London 1862 \\
\textbf{■} & Steinitz \hfill Giuoco Pianissimo – C50
\end{tabular}
\end{center}

\begin{verbatim}
□ Dubois London 1862
■ Steinitz

\end{verbatim}

0 : 1
2.8 Other tools for annotation

When you open a commentary (whether by \[ or by \{), \TeX\text{mate} ‘undoes’ the last move (assuming that the commentary will offer alternatives to it). Therefore the first move in the commentary will feature the same move number, and be played by the same side, that the last move in the main game (or in the mother variation). Sometimes, however, you open a commentary to talk about what the answer can be to that last move. For those occasions, \TeX\text{mate} 2 has the command \\texttt{\ahead}.

A good illustration is the last move of our Dubois–Steinitz game (see diagram).

\begin{center}
\begin{tikzpicture}
\end{tikzpicture}
\end{center}

The point is that Black threatens mate with the g3 pawn on h2; White could try to avoid it by taking the pawn, but then the rook mates on h1. What we want for the last move is ‘\texttt{\ahead} \texttt{\ahead} 14. . . \texttt{\ahead} Bxf3 \texttt{\threat<gxh2\#>\[}, and if now
\texttt{\ahead hxg3 Rh1\#\resigns()].}

1. e4 e5 2. \texttt{\textdollar}f3 \texttt{\textDelta}c6 3. \texttt{\textDelta}c4 \texttt{\textDelta}c5 4. d3 \texttt{\textDelta}f6 5. \texttt{\textDelta}g5?! [\texttt{\textDelta}5. \texttt{\textDelta}c3] 5. . . d6 6. 0–0?! h6 7. \texttt{\textDelta}h4 g5 8. \texttt{\textDelta}g3 h5! 9. \texttt{\textDelta}xg5 h4! 10. \texttt{\textDelta}xf7 h\times g3!! 11. \texttt{\textDelta}xh8 [11. \texttt{\textDelta}xh8 \texttt{\textfrak{e}}7! (11. . . \texttt{\textDelta}g4? 12. \texttt{\textfrak{e}}d2 \texttt{\textDelta}d4 13. \texttt{\textDelta}c3 \texttt{\textfrak{e}}7 14. \texttt{\textfrak{e}}h6++) 12. \texttt{\textDelta}f7 \texttt{\textDelta}xf2+ 13. \texttt{\textfrak{f}}xf2 gxf2+ 14. \texttt{\textfrak{f}}xf2 \texttt{\textDelta}g4+ 15. \texttt{\textDelta}g3 \texttt{\textfrak{f}}f6 16. \texttt{\textfrak{f}}f3 \texttt{\textfrak{g}}7–+] 11. . . \texttt{\textDelta}g4 12. \texttt{\textfrak{e}}e1 \texttt{\textDelta}d4 13. \texttt{\textDelta}c3\]
[13. h3 \=e2+ 14. \=h1 \=xh3+ 15. gxh3 \=f3#] 13... \=f3+! 14. gx\=f3
\=x\=f3 \=g\=xh2#, and if now 15. h\=xg3 \=h1#
0 : 1

We can also refine the comment to moves 12 by Black and 13 by White with the specification of the threat. This could not have been done with \texttt{threat} (section 2.3), because the threat involves a whole variation, not simply a move. With \texttt{Threat<threatened variation>}, \texttt{TeXmate} will typeset the \texttt{<threatened variation>} with appropriate move numbers, etc. Unlike \texttt{threat}, \texttt{Threat} does not include the $\Delta$ sign, but this can be added to the first move if necessary. Sometimes a space must be forced—the idea is that \texttt{Threat} can be used in connection with running text, so nothing is rigidly added. (On the other hand, since this is not a real variation playable on the board, \texttt{skak} is turned off.)

So, by saying ‘Nd4 \texttt{Threat<} \texttt{withidea Ne2+ Kh1 Rxh3+ gxh3 Bf3#\>} Nc3\texttt{onlymove}’ we get ‘12... \=d4 \=A13... \=e2+ 14. \=h1 \=xh3+ 15. gxh3 \=f3# 13. \=c3\texttt{\square}14. \=d5’, a better option for these moves than we have had so far.

\texttt{dummy} On the other hand, the commands \texttt{dummy} and \texttt{dddummy} make \texttt{TeXmate} advance half a move or a complete move (that is, a movement by both players). They can be used in commentary to talk about what is to come, and they are in some senses more flexible than \texttt{ahead}. But they remain in \texttt{TeXmate} mainly for compatibility. Their main drawback is that they confuse \texttt{skak} (that is following the game, so that the moves have to make sense, and the move numbers have to be consistent). In \texttt{TeXmate} 2, therefore, they immediately turn \texttt{skak} off: for the remainder of the variation (or sub-variation), \texttt{skak} will not try to follow the game. The main consequence of this is that the variation cannot be automatically diagrammed.

\texttt{white} Similarly, the old commands \texttt{white} and \texttt{black}, that force \texttt{TeXmate} to take the next move as one done by the indicated side, have to turn \texttt{skak} off.

2.9 Multiple variations

In complicated games, a commentator will often need to examine several alternatives in a given position. The tools given so far are not
satisfactory for this. In old \TeXmate it could be achieved by handling 

groups properly, but this is not exactly trivial for the user (who is 

thinking of variations that are already complicated as it is!). In ad-

dition, this approach puts \textit{skak} off the game, and will create strange 

results.

So, \TeXmate2 provides an additional tool for this, that turns out 
to be very powerful and useful. It is the family of environments 

\{variations\}.

Again, the final position of Dubois–Steinitz provides illustration. 
White could also try \textit{advancing} the pawn. So, having two alternatives 

for White’s 14, let’s discuss the different \{variations\} environments.

\begin{variations}
\var ⟨variation⟩
\var ⟨variation⟩
\end{variations}

is designed for running commentary (not a lot of text). It makes the 

first move of each variation bold, and puts a ‘;’ between variations:

14. . . \textit{B}×f3 \textit{△}g×h2# [If now 15. h×g3 \textit{□}h1#; 15. h3 \textit{□}×h3 

\textit{△}□h1#] 0 : 1

was produced by:

\textit{B}xf3 \textit{threat}<gxh2#>[|If now |\ahead\begin{variations}
\var hxg3 Rh1#%
\var h3 Rxh3\textit{threat<Rh1#>\end{variations}}\resigns

\var* The starred \var* forgoes any formatting (no bold, no semicolon). 

It is useful when one of the variations is embedded in text. You 
can always force the bold first move by saying \var*\textbf{series}. In 
general, font can be set immediately after \var or \var*, and it will 
apply to the first move of the variation only.

\begin{variations*}
\begin{variations*} creates a list of variations where no vari-

ation has formatting (thus giving a shorthand for many \var*'s). Of 
course it has to be closed by \end{variations*}.

On the other hand, \begin{variations} has a very different behav-
ior when it appears in a ‘text commentary’ (i.e., one open with \}
rather than []). Then it invokes another environment (usually a list, by default an \{itemize\}), where each \texttt{var} is an \texttt{item}. (The starred \texttt{variations*}, however, behaves as in non-text commentary.)

So, a more explicit commentary to the final position of our game is:

\begin{variations}
\texttt{Bxf3} ![\text{threatening mate on h2. If now}]
\texttt{h4 \text{ahead}}\begin{variations}
\texttt{hxg3 Rh1}\#
\texttt{h3 Rxh3}\text{threat<Rh1#>\end{variations}}|
\text{In view of that, White resigned.|}\resigns|
\end{variations}

14... B\text{xf3} threatening mate on h2. If now

- 15. h\text{xg3} $h1\#
- 15. h3 $xh3 \triangle h1\#
\text{In view of that, White resigned.} 0 : 1

\texttt{variationsEnvironment} List environments defined by other packages (\texttt{paralist}, \texttt{enumerate}, etc.) can be used. For example:

\texttt{\VariationsEnvironment}
  \{\begin{enumerate}[a)]\}
  \{\end{enumerate} \}

Different \texttt{variations} environments can be nested one into another, at least in some combinations (that is, sometimes there are problems, but it’s been hard to understand why). It seems that the main requirement is that they don’t appear at the same level of commentary. Here is a full analysis from a game that actually calls for commentary this deep. This is the input:

|Bd4!! f5\onlymove Bxg7+\onlymove Kg7
\begin{variations}
\texttt{var Kg8 Qg3! Bxd6 Bxc6 Qxc6 Qg6! Rf7\onlymove }
\texttt{Bh6+ Kh8 Qxf7 Rg8 Bg5! Rg7\onlymove Qe8+ Bf8}

\section{Setting up a position}

\texttt{\textbackslash position} With the command \texttt{\textbackslash position}, you can set up the board to any given position. As in \texttt{skak} and old \texttt{\TeX}mate, the position itself is indicated in FEN format: line by line, from top to bottom, lowercase for black pieces, uppercase for white, and numbers for empty squares—lines separated by \\/. For \texttt{\textbackslash position}, the lines do not have to have all 8 squares: a \\ at the end of a line instructs \texttt{\TeX}mate to ‘fill in’ the remaining places with empty squares.

It’s much easier just to see one than to read the paragraph above:

\texttt{\textbackslash position{r1bq1rk/4bppp/p1p/1p1nR/%
8/1BP/PP1P1PPP/RNBQ2K}}

creates a position that can be visualized with \texttt{skak}'s \texttt{\textbackslash showboard}:

\begin{center}
\texttt{\textbackslash showboard}
\end{center}

This is a Marshall-Attack position, and it’s White’s turn to make his eleventh move. If moves are going to be typeset for this diagram, we need \texttt{\TeX}mate to know it’s move 11 by white. That’s easy enough
with old commands (\texttt{\textbackslash white 11}), but in \TeXmate 2 we have to instruct \texttt{skak} as well.

In order to do that, \texttt{\textbackslash position} has an optional argument, something like \texttt{[b 19]}—whose turn it is (\texttt{w} or \texttt{b}), and what move number it is. The diagram above should be created with

\begin{verbatim}
\texttt{\textbackslash position[w 11]\{r1bq1rk/4bpp/p1p/1p1N/8/1BP/PP1P1PPP/RNBQ2K\}}
\end{verbatim}

The position is now in memory, and will be upgraded with any new moves. It can be sent, at any point, to diagram memory with \texttt{\textbackslash toD}.

\texttt{\textbackslash position} is designed for quick diagram drawing (where it does not matter who can castle where, etc.). For complete FEN descriptions of positions (for example from an external source), \texttt{skak}'s \texttt{\textbackslash fenboard\{(FEN position)\}} can be used. It has been modified so that \texttt{\TeXmate} will know who is to play and what the move number is.

\begin{verbatim}
\texttt{\textbackslash diagram The old \TeXmate command \textbackslash diagram, kept for compatibility, has the effect of \textbackslash position followed by \textbackslash showboard. It now accepts the optional argument (turn and move number) and passes it on to \textbackslash position.}
\end{verbatim}

\section{Customization}

\subsection{The input}

\texttt{\textbackslash pieceinitials} By default, input goes by the piece initials customary in English (Rook, \texttt{k}Night, Bishop, Queen, King). This can be changed, so that input can be though of (or copy-pasted in) other languages. Adding the Pawn at the beginning, and going left-to-right through the initial position, \texttt{\textbackslash pieceinitials\{(new initials)\}} will change the initials.

The effects of this are:

\begin{itemize}
  \item Input in chess mode uses the new initials for pieces.
  \item \texttt{skak} will also change. Even the commands that are not interfaced by \TeXmate (notably \texttt{\textbackslash showonly\{pieces-to-show\}} will make use of the new initials.
\end{itemize}
Position setup with \texttt{position}, \texttt{diagram}, and \texttt{fenboard} will use the new language.

\texttt{chessfss}-directed output after \texttt{usetextfig} will use the new language.

The architecture of the different programs even allows input in one language and output in another: issue \texttt{pieceinitials} for the input language, and follow it immediately with \texttt{chessfss}'s \texttt{setfigtextchars} to set the output. (Of course, \texttt{usetextfig} must be in place for the latter to have any consequences.)

There is no more customization to the input to be done: \texttt{castling} can be input either with zeroes or with O's. Captures can be input either with ‘x’ or with ‘:’—or not at all, hoping for \texttt{skak} to be OK with that (it often is). Of course, in the latter case you would lose any automatic formatting of captures. Checks are a ‘+’ or nothing—no problem here. It is strongly recommended to input Promotions with the ‘=’ sign (‘g1=Q’), because \texttt{skak} will understand it.

So, the system is immediately ready to read PNG games (without commentary), as long as the input language (the piece initials) is not changed.

### 3.2 The output: signs

\texttt{\textbackslash Castle} If you want castles like “0–0–0”, type \texttt{\textbackslash Castle0} (default). If you like them like “O–O–O”, type \texttt{\textbackslash CastleO}.

\texttt{\textbackslash takes} Predefined essentially as \texttt{\$times\$}, you can \texttt{\renewcommand\textbackslash takes} to substitute your favorite sign for captures (a colon? nothing?).

\texttt{\textbackslash checksign} Checks are \texttt{\textbackslash checksign} (‘+’ by default). Mate is \texttt{\#} (‘#’) by default. There is a \texttt{\textbackslash mate} sign in the informator fonts of \texttt{skaknew}, that looks like ‘#’, and to use it you can \texttt{\renewcommand\textbackslash \#\{\textbackslash mate\}}.

### 3.3 The output: punctuation

The material between moves and move numbers can be customized. The appropriate commands, their function, and their default, are in Table \ref{tab:output-punctuation}.
Table 1: Punctuation commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Meaning</th>

<td>Comm. level 2</td>
<td>normal</td>
<td>( and )</td>
</tr>
<tr>
<td>iv</td>
<td>Comm. level 3</td>
<td>italic</td>
<td>( and )</td>
</tr>
</tbody>
</table>

Table 2: Levels, default fonts and delimiters

\...font  Fonts and delimiters can be changed. Each level has commands for ‘font,’ ‘open,’ and ‘close.’ Those of level three, for example, are \iiiopen, \iiiclose, and \iiifont. These three are defined by default as follows:
\let\iiifont\normalfont
\newcommand\iiiopen{()}
\newcommand\iiiclose{\leavevmode\unskip)
and the others are analogous. They can all be redefined. The \leavevmode\unskip in \iiiclose removes the space that is added by TeXmate after the last move.
Similarly, the space before and after the delimiters is embedded in \TeXmate. \unskip, or its safer version \leavevmode\unskip can be used to remove these spaces. For example, to use the em-dash as delimiter for the third level, the redefinitions should be

\renewcommand\iiiopen{\leavevmode\unskip---}
\renewcommand\iiiclose{\leavevmode\unskip---}

\...opent\...closet

The delimiters work for commentaries open with [. For commentaries with \[ ('text commentaries'), the commands are \iopent and \icloset, etc. ('t' for 'text'). In principle they are all defined as \relax (nothing), but they could be redefined so that, for example, all commentary at level ii starts on a new paragraph.

The regular variations in a \{variations\} environment within a \[ commentary (not a \[ one) make their first move bold by default. This is command \varfont, which is originally equivalent to \bfseries, but can be changed. This is invoked by \var, but not by \var*.

\steplevel\backlevel

Levels can be arbitrarily traversed with commands \steplevel and \backlevel. This only affects fonts and typesetting uses, so there is no concern about getting skak confused. It might confuse the reader, though.

3.5 Diagrams

This section applies to intrinsic \TeXmate diagram-drawing tools. The tools of both skak (notably \showboard, that typesets the current position) and chessfss (that provides commands for font, size, each piece on each kind of square, etc.), are kept independent, so that modularity is ensured.

In fact, \TeXmate 2 does not have some possibilities of old \TeXmate. Its diagrams are always 8 × 8 squares. chessboard provides excellently for less standard situations. This program works hand in hand with skak, which means that when \TeXmate is used with this latter, there will be also communication with chessboard.\footnote{However, skak and chessboard do not pass information on to \TeXmate.}
3.5.1 Diagram font, size, etc.

\TeXmate does not deal with these matters, which are delegated to the package \texttt{chessfss}. The latter's \texttt{\setboardfontsize{12pt}} is issued by \TeXmate as a default, but there is no further handling. In addition, this latter default only has an effect when \texttt{skak} is not loaded, since otherwise \texttt{skak}'s commands (\texttt{\tinyboard}, \texttt{\smallboard}, \texttt{\normalboard}) take precedence. \TeXmate sets \texttt{\smallboard} by default.

3.5.2 Issuing the diagrams

Diagrams are \textit{issued} at one point, and \textit{printed} at another. This allows the typesetting of diagrams side by side without regard to what the current position.

Issuing the diagrams is done by the commands explained in section \ref{diagramsign} namely \texttt{\toD}, \texttt{\toD*}, and \texttt{\preparediagram}. The regular version \texttt{\toD} inserts the contents of \texttt{(D)}, which by default is \texttt{' (D)'}, but can be freely redefined. \texttt{\toD*} does not insert \texttt{\diagramsign}.

The diagrams are then put in memory—as \LaTeX boxes—together with some accompanying material: player names, move number, etc. (Note that \texttt{skak}'s \texttt{\showboard} or \texttt{chessboard}'s \texttt{\chessboard} do not ‘issue’ a diagram in \TeXmate’s terms, but simply print the current or given position.) This section describes the basic customization of the diagram boxes. It actually tells some white lies, so section \ref{diagramcustomization} below explains in full detail.

By default, diagrams:

- Are not numbered.
- Put Black’s name (whatever was given by \texttt{\bname}) above the diagram, boldface.
- Put White’s name (\texttt{\wname}) below, boldface.
- Typeset the last move (the argument to \texttt{\toD} or \texttt{\toD*}) below White’s name.
- \textbf{Analysis} diagrams (diagrams issued within a commentary, i.e., between \[ and ] or \{ and\}) override the default behavior: instead of the players’ names, the word ‘Analysis’ appears at the top of the diagram, and the last move appears at the bottom.
\topdiagramnames  Players’ names on top of the diagram.
Like this: ‘Dubois–Steinitz’.
\bottomdiagramnames  Players’ names at the bottom of the diagram.
\diagramnames  White’s name at the bottom, Black’s on top (default).
\nodiagramnames  No players’ names.
\diagramnumber  Diagram number on the top of the diagram (above names, if any).
The number is formatted by the current version of \TheDiagram—by default something like ‘4’.
Regular (lower-case) \thediagram is intended for running-text reference.
\nodiagramnumber  No diagram numbers (default).
\leftdiagramturn  Turn marker at the left of the diagram.
\rightdiagramturn  Turn marker at the right of the diagram.
\nodiagramturn  No turn marker (default).
\diagrammove  Last move at the bottom (default).
\nodiagrammove  No last move.
\analysistop  What goes by default on top of analysis diagrams. Defined originally as ‘Analysis’.

Table 3: Command for diagram information

The commands of Table 3 govern these defaults. They are user-modifiable with \renewcommand, with one warning: these commands (and in general non-chess stuff) should go outside chess mode.

When a turn marker is requested, \TeXmate will use the contents of either \whiteturnmarker or \blackturnmarker. These, by default, are defined as:

\newcommand*\whiteturnmarker{\%  \raisebox{.75\expandafter\ht\csname chessdiag@roman@temptcnta\endcsname}{\%  \textsl{W}}\%}  }

where the first part is responsible for raising the symbol to three-quarters the height of the diagram. Modification of the coefficient .75
and of the actual contents of the box should (or the space after it) should pose no problem.

On the other hand, it is possible to set the top and the bottom of one diagram (the one that is issued next, with \toD or \toD*) with \nextdiagramtop{\langle header\rangle} and \nextdiagrambottom{\langle footer\rangle}.

For example:

\nextdiagramtop{\wname--\bname}
\nextdiagrambottom{Final position after}
\toD*{Bxf3}
\makediagrams

produces

![Chess diagram]

Final position after
10...\text{\textquotesingle}xf3

To set the top or bottom of all future (non-analysis) diagrams at once, the commands \diagramtop and \diagrambottom can be redefined with \renewcommand. For this, the commands \wname and \bname, which hold the player names (as given at the beginning of the game with \whitename and \blackname, as in section 2.2), might prove useful.

All the text typeset by \makediagrams is subject to \makediagramsfont. By default it means \small, but it can be changed at any point.

### 3.5.3 Printing the diagrams

The diagrams are actually typeset with the command \makediagrams. This command will typeset, in principle, all diagrams in memory, framed and separated by \hfill's. (There is therefore no need for \centering, which in fact can disturb the resulting layout.)
An optional argument to \texttt{\makediagrams[(n)\textregistered]} will tell \textsc{Texmate} to typeset only the first \(n\) diagrams in memory. The rest of the diagrams take then the memory positions of those that were typeset.

By default, the number of diagrams that can be held in memory is 3. It can be enlarged with the command \texttt{DiagramCache\{\textit{number}\}}. So, a page of nine diagrams like page 24 below can be composed thus (the counter is reset because previous diagrams in this document have stepped it):

\begin{verbatim}
\DiagramCache{9}
\setcounter{diagram}{0}
\tinyboard
\diagramnumber
\let\makediagramfont\footnotesize
\% First diagram
\position[w 22]{r1q4r/2p2bQ/2p2p1k/6pp/4N/6R/PPP2PPP/2KR}
\preparediagram{}{22.?}\label{pageref}
\% Second diagram
\position[b 20]{r5k/1bpp1ppp/1p1b3r/pP2n1q/2PB/P3PPP/3Q8R1P/R2N2K}
\preparediagram{}{{20\dots?}}
\end{verbatim}

\texttt{\textit{etc.}}

\begin{verbatim}
\DiagramCache{9}
\DiagramCache{9}
\DiagramCache{9}
\end{verbatim}

Almost all the layout parameters described in the previous section have an effect when the diagram is \textit{issued}. However, the switches for
1

2

3

4

5

6

7

8

9
move number and last move (i.e., whether and where they should be put) are enforced at the moment of printing with \makediagrams.

3.5.4 Diagrams and cross references

Diagrams are counted (whether the number is printed or not) with the diagram counter. When diagrams are printed with \makediagrams, this counter is \refstepped, i.e., a \label can be assigned to it for cross references. The mechanism is not completely implemented in \TeXmate, not least because there is little of a ‘standard’ use. As it stands, the main problem is that the user cannot assign individual \label’s to diagrams that printed with the same \makediagrams. On the other hand, if the latter command is used for one diagram at a time, cross referencing is fully functional.

3.5.5 Detailed mechanism description

The commands described in the previous section are not intended to provide full control on diagram layout, but rather simple tools for the needs of most of the time. More extensive customization will require hands-on programming. The diagram mechanism in \TeXmate2 has been designed to make this task easier, should it arise. This section explains it.

As has been said, a diagram is \textit{issued} first and \textit{retrieved} later. The issuing commands (\texttt{\toD}, \texttt{\toD*}, and \texttt{\preparediagram}) build four \LaTeX boxes and one command containing the diagram and the accompanying information. The names of these boxes contain the diagram number in lowercase Roman numerals. If, for example, a diagram in the third memory position is being issued, the following boxes are created:

- \texttt{\chessdiagiii} holds the diagram itself—and it is a copy of either \texttt{\showboard} or (when \texttt{skak} is not loaded) \TeXmate’s own typesetting of the diagram with \texttt{chessfss} commands.

- \texttt{\chessdiaggiiitop} holds whatever goes on the top of the diagram. It can be: \textit{a)} with the \texttt{\...diagramnames} switches, the names of the players (or of Black); \textit{b)} whatever was defined by
the user as \texttt{\textbackslash diagramtop}; or c) the first argument of the user’s \\
\texttt{\textbackslash preparediagram}.

- \texttt{\textbackslash chessdiagiiibottom} holds whatever goes on the bottom of \\
the diagram. Analogous.

- \texttt{\textbackslash chessdiagiiimove} holds the typeset form of the argument to \\
\texttt{\textbackslash toD} or \texttt{\textbackslash toD}. It is empty in the case of \\
\texttt{\textbackslash preparediagram}.

In addition, each diagram also has a command, \texttt{\textbackslash chessdiagiiiturn} \\
for the third diagram. This is set, according to whose turn it is \\
when the diagram is issued, to expand to either \texttt{\textbackslash whiteturnmarker} \\
or \texttt{\textbackslash blackturnmarker}.

The default \texttt{\textbackslash makediagrams} (the command that is most likely to \\
change in customization) is a fairly simple usage of these boxes and \\
commands. Essentially, it follows the switches for diagram number, \\
turn, and last move (\texttt{\textbackslash if@numbertop}, \texttt{\textbackslash if@turnleft}, \\
\texttt{\textbackslash if@turnright}, \texttt{\textbackslash if@movebottom}) to typeset a \texttt{\textbackslash shortstack[c]} containing, from top \\
to bottom

\begin{verbatim}
the diagram number
\texttt{\textbackslash chessdiagiiitop}
\texttt{\textbackslash chessdiagiii}
\texttt{\textbackslash chessdiagiiibottom}
\texttt{\textbackslash chessdiagiiimove}
\end{verbatim}

For items to the left or the right, it builds 0-wide boxes (so that they \\
don’t affect centering and spacing) that contain \texttt{\textbackslash whiteturnmarker} \\
or \texttt{\textbackslash blackturnmarker}.

The same applies for all diagrams, just replacing the inner \texttt{iii} \\
by the Roman numeral (lowercase) of the position of the diagram in \\
memory. Note that this number is not the diagram number, but its \\
slot in memory. After using the boxes in that way, \texttt{\textbackslash makediagrams} \\
calls \texttt{\textbackslash killdiagrams}, that deletes the diagrams from memory (and \\
moves any remaining diagrams to the first memory positions).

3.6 Cosmetics

There are other tools in \texttt{\textbackslash l\textbackslash Xmate} that are provided ‘as is,’ with- \\
out complicated customization, because there is no standard. These
should be modified or directly replaced to follow individual preferences.

The game title is one of them. The pieces of information already implemented (with the user commands described in section 2.2) are: the players’ names, held in \wname and \bname; their ratings, \@welo, \@belo; the event, @tourn; the opening, @opening; and the ECO code, held in @eco. The latter is the only one that adds something to the user’s input: \def\@elo{ -- \textbf{#1}}.

Then, \makegametitle simply uses these variables. Redefining it will not affect the program in any way.

\result Game result is also a ‘cosmetic.’ The current definition of \result{⟨result⟩} puts a boldface copy of its argument on the right margin of the current line, if it fits, or of the next one, if it doesn’t. (When the command is encountered not in the main game, but in the commentaries, the argument is simply typeset.)

\whitewins \blackwins \drawn\resigns simply means \result{1\,:\,,\,0}; \blackwins and \drawn are analogous. Finally, \resigns issues \whitewins if it’s Black’s turn, or \blackwins if it’s White’s.

4 \texttt{TEXmate 2 and skak}

The command \showboard in the package skak has been mentioned repeatedly in this manual. It can be used with \texttt{TEXmate}, and it provides total flexibility for the typesetting of the diagram, forgoing the automatic formatting that \texttt{TEXmate} performs.

Another important command, also mentioned before, is \fenboard. But there are other commands from skak whose use might prove an extension to \texttt{TEXmate}’s capabilities. This is mainly connected to saving and restoring positions in memory or disk. skak’s \storegame{⟨key⟩} saves a position in memory, to be restored by \restoregame{⟨key⟩}. With this tool, for example, it is possible to quote an independent game in commentary, and still have the capabilities of skak. All that is needed is to store the main game, type \newgame, quote the alternative game, issue any diagrams from it, and restore the main game when done. (skak also offers \sidegame for this purpose, but its use with \texttt{TEXmate} is not as straightforward.)
If, for any reason, the capabilities of \texttt{skak} are an obstacle rather than a utility, \texttt{skak} can be turned off with \texttt{SkakOff}. \TeXmate will then typeset the moves as given, without passing them onto \texttt{skak}, and any potential problems and error messages caused by \texttt{skak} trying to follow the game will be avoided. \texttt{SkakOn} turns all capabilities back on.

\TeXmate 2 has a small tracing utility of \texttt{skak}'s workings: option \texttt{[diagnostics]} will type out messages with the moves that have been passed on to \texttt{skak}, helping understand where the latter stands respect to the typeset game and analysis.

\section{Chess symbols}

Chess symbols, as chess fonts, are delegated to \texttt{chessfss} in \TeXmate 2. There are some differences with the output of \TeXmate, for the latter used to modify some of the symbols (in size, in position, etc.). It has been decided, for the sake of modularity, to forgo these modifications in \TeXmate 2. Table 4 lists the symbols (with \TeXmate command names).
